

A BEGINNER'S MANUAL

Notion

One workspace for notes, docs, projects, and databases, with AI built in

For complete beginners • October 2026 edition • Print edition · US Letter

GUIDES FOR EVERYTHING

Notion

One workspace for notes, docs, projects, and databases, with AI built in

Notion is a flexible workspace where you write notes and documents, manage projects and to-do lists, build simple databases, and share it all with others. Think of it as digital LEGO: a handful of simple pieces (pages, blocks, and databases) that snap together into almost anything, from a personal journal to a whole company wiki.

This manual starts with the building blocks, teaches the database features that make Notion powerful, sets up a real project tracker and a personal dashboard, and covers Notion AI, agents, sharing, and connecting Notion to other AI tools.

HOW TO READ THIS MANUAL

- **Tip** — a shortcut or good habit.
- **Note** — useful background.
- **Warning** — easy to get wrong.
- **Danger** — can lose data, money, or access.
- `$ command` — text you type, exactly as shown.
- Settings › Privacy — a menu path to click.

New words appear in **bold** the first time and are collected in the Glossary at the back.

Facts, prices, and menu paths were checked against official documentation in October 2026. Software changes quickly — when something on screen doesn't match, trust the product's current docs.

CHAPTER 1

Welcome to Notion

IN THIS CHAPTER

- What Notion is good for
- Creating your account and workspace
- Finding your way around the screen

1.1 What people use Notion for

- **Notes and journals**: class notes, meeting notes, daily logs.
- **Documents and wikis**: how-to guides, company handbooks, recipes.
- **Task and project management**: to-do lists, Kanban boards, content calendars.
- **Databases**: reading lists, client lists (a simple CRM), inventories, habit trackers.
- **Websites**: publish any page to the web with Notion Sites.
- **AI help**: write, summarize, answer questions about your workspace, and automate busywork.

1.2 Get started

CREATE YOUR ACCOUNT

1. **Go to notion.com** and click **Get Notion free**, or download the desktop and mobile apps from notion.com/download.
2. **Sign up** with your email, Google, or Apple account.
3. **Choose how you'll use it**
   for yourself, with a team, or for school. This just picks starter templates.

4 **Name your workspace.**
A **workspace** is your whole Notion account space; you can create more later (for example, one personal, one for work).

1.3 The Notion screen

AREA	WHAT IT IS
Sidebar (left)	Your pages in sections: **Teamspaces** (shared), **Private** (just you), and **Shared** (pages others shared with you); plus Search, Home, Inbox, and Settings
Page (center)	Whatever you're working on
Top bar	The page's location (its "breadcrumb"), **Share**, comments, updates, and the ••• menu
Notion AI	The AI icon at the bottom right, or press `Space` on an empty line

> **TIP**
> Press `Cmd` + `P` (Mac) or `Ctrl` + `P` (Windows) to search everything. It's the fastest way to jump to any page.

CHAPTER 2

Pages and Blocks

Everything in Notion is made of **pages**, and every page is made of **blocks**.

2.1 Blocks: the LEGO bricks

A **block** is any single piece of content: a paragraph, a heading, a to-do checkbox, an image, a table, an embedded video. Each block can be moved, turned into another type, or nested inside another.

- Hover over any block and drag the ⋮⋮ handle to move it.
- Click the handle to **Turn into** another type, change its color, or duplicate or delete it.
- Drag a block to the far right of another block to create **columns**.

2.2 The slash command

Type `/` anywhere to insert any block:

TYPE	TO GET
`/h1`, `/h2`, `/h3`	Headings
`/todo`	A to-do checkbox
`/bullet`, `/num`	Bulleted or numbered lists
`/toggle`	A collapsible section
`/callout`	A highlighted box with an icon
`/code`	A code block
`/table`	A simple table
`/database`	A full database (Chapter 4)
`/image`, `/video`, `/file`	Media and files

`/embed`	Embed a map, form, Figma file, and more
`/page`	A new page inside this one
`/button`	A button that runs actions when clicked

2.3 Markdown shortcuts

Type these at the start of a line for instant formatting:

TYPE	RESULT
`#` then space	Heading 1 (`##` for H2, `###` for H3)
`-` or `*` then space	Bullet
`1.` then space	Numbered list
`[]`	To-do checkbox
`>` then space	Toggle
`"` then space	Quote
`---`	Divider line
```` ``` ````	Code block
`**text**`	**Bold**
`` `text` ``	Inline code

2.4 Pages inside pages

Any page can contain other pages, so you can organize everything like folders. Type `/page` to create a subpage, or `[[` and a name to link to an existing page (or create a new one). Type `@` to mention a person, a page, or a date such as `@tomorrow`; dates can carry reminders.

> **TIP**
> Keep your sidebar tidy with a few top-level "home" pages, such as **Home**, **Projects**, **Notes**, **Areas**, and **Archive**, and put everything else inside them.

CHAPTER 3

Databases: Notion's Superpower

A **database** is a collection of pages that share the same set of **properties** (fields). Each item is a full page you can open and write in, *and* a row with data like a date, a status, or a person. The same database can be shown many different ways.

3.1 Create a database

YOUR FIRST DATABASE: A READING LIST

1. **Create a new page** called "Reading list".
2. **Type** `/database` and choose **Database – Inline** (or **Full page**).
3. **Rename the default columns.**
   "Name" holds the book title.
4. **Add properties.**
   Click **+** at the end of the header row. Add **Author** (Text), **Status** (Status: Not started / In progress / Done), **Rating** (Select: ★ to ★★★★★), and **Finished** (Date).
5. **Add a few books.**
   Click **New** or the empty row at the bottom.
6. **Open a book** by hovering over its name and clicking **Open**, and write your notes inside it. Every row is a page!

3.2 Property types

PROPERTY	HOLDS	EXAMPLE USE
Text	Words	Author, notes
Number	Numbers, money, percentages	Price, hours
Select / Multi-select	One or several tags from a list	Genre, priority
Status	To-do / In progress / Complete groups	Task progress
Date	A date or range, with optional reminder	Due date
Person	Workspace members	Assignee
Checkbox	Yes or no	Paid?
URL, Email, Phone	Links and contacts	Website
Files & media	Uploaded files	Contract PDF
Relation	Links to items in another database	Tasks ↔ Projects
Rollup	Summarizes data through a relation	% of tasks done
Formula	Calculates from other properties	Days until due
Created time, Last edited	Automatic timestamps	Audit trail

3.3 Views: the same data, many ways

Click + next to the existing view's name, at the top left of the database, to add a view:

VIEW	SHOWS ITEMS AS...	GREAT FOR
Table	Rows and columns	Editing lots of data
Board	Cards in columns, grouped by status or tag	Kanban task tracking
Calendar	Items on their dates	Content calendars, deadlines
Timeline	Bars across time	Project schedules
List	A clean list of pages	Notes, docs
Gallery	Cards with cover images	Recipes, portfolios, moodboards
Chart	Bar, line, or donut charts	Dashboards
Form	A fill-in form that creates items	Requests, sign-ups, surveys
Map	Pins from an address property	Places, travel plans

Each view has its own **Filter** (show only some items), **Sort** (order them), and **Group** (split into sections). For example, make a "Currently reading" board view filtered to *Status is In progress*.

3.4 Relations and rollups, simply

A **relation** connects two databases. Link a **Tasks** database to a **Projects** database and each task knows its project, and each project lists its tasks. A **rollup** then summarizes across that link, such as "count of tasks" or "percent of tasks done," shown right on the project.

3.5 Formulas, simply

A **formula** property calculates a value. Two useful ones:

DAYS UNTIL DUE

```
dateBetween(prop("Due"), now(), "days")
```

OVERDUE FLAG

```
if(prop("Due") < now() and prop("Status") != "Done", "⚠️ Overdue", "")
```

> **TIP**
> Don't know the formula? Ask Notion AI: "Write a formula that shows how many days are left until the Due date."

CHAPTER 4

Build a Project Tracker

Let's combine everything into a small but real system: projects with tasks.

BUILD PROJECTS + TASKS

1. **Create a page** called "Work hub".
2. **Add a Projects database** (`/database` , full page). Properties: **Status** (Status), **Owner** (Person), **Deadline** (Date).
3. **Add a Tasks database** inside Work hub. Properties: **Status** (Status), **Assignee** (Person), **Due** (Date), **Priority** (Select: High, Medium, Low).
4. **Link them.**
   In Tasks, add a **Relation** property pointing to **Projects**, and switch on **Show on Projects** so both sides see the link.
5. **Add progress.**
   In Projects, add a **Rollup**: relation *Tasks*, property *Status*, calculate *Percent per group › Complete*. Show it as a bar.
6. **Create useful views of Tasks:**
   a **Board** grouped by Status, a **Calendar** by Due date, and a **My tasks** table filtered to *Assignee contains Me*.
7. **Add a template.**
   In Tasks, click the arrow next to **New**, choose **+ New template**, and add a checklist ("Definition of done") that every new task starts with.

> **NOTE**
>
> Prefer not to build from scratch? The **Templates** gallery (in the sidebar, or notion.com/templates) has thousands of ready-made systems: project trackers, CRMs, habit trackers, and more. Duplicate one, then customize it.

4.1 Automate the busywork

- **Buttons** (`/button`): one click to add a pre-filled task, change several properties, or open a page.
- **Database automations** (paid plans): "when Status changes to Done, set Completed date to today and notify the owner in Slack." Find them under the ⚡ icon at the top right of a database.
- **Recurring templates:** make a template repeat, such as "Weekly review every Friday."

CHAPTER 5

A Personal Dashboard

A **dashboard** is a home page that pulls your important stuff into one view.

MAKE A "HOME" DASHBOARD

1. **Create a page called Home** and give it an icon and a cover image (hover near the title to add them).
2. **Add columns.**
   Type `/2` and choose **2 columns**, or drag blocks side by side.
3. **Left column:**
   add a **linked view** of your Tasks database (`/linked`), filtered to *Assignee is Me* and *Due is this week*, shown as a **List**.
4. **Right column:**
   a linked **Calendar** view, a callout with this week's focus, and a few quick links (`[[` to link pages).
5. **Add a Chart view** of tasks by status for a visual check-in.
6. **Pin it.**
   Right-click the page in the sidebar and choose **Add to Favorites**.

A **linked view** shows a database that lives elsewhere, filtered and styled for this spot. Changes made there update the original.

CHAPTER 6

Notion AI and Agents

Notion AI is built into the workspace. It can write and edit, answer questions using your pages (and connected apps), take meeting notes, build databases, and carry out multi-step tasks as an **agent**.

6.1 What's included

PLAN	AI FEATURES
Free, Plus	A limited trial of Notion AI features
Business, Enterprise	Notion Agent, AI Meeting Notes, Enterprise Search across connected apps, and the full set of AI writing tools
Custom Agents	Free to try, then paid with **Notion credits** (an add-on: $10 per 1,000 credits per month)

6.2 Ways to use Notion AI

- **On an empty line:** press `Space` and ask: "Draft a project kickoff agenda."
- **On selected text:** select it, then choose **Ask AI** to improve, shorten, translate, or change the tone.
- **In the AI panel** (AI icon at the bottom right): ask questions across your workspace. "What did we decide about the launch date?" It answers with links to the source pages.
- **AI Meeting Notes:** type `/meeting` to transcribe and summarize a meeting with action items.
- **AI in databases:** add AI-generated properties such as summaries, keywords, or translations that fill in automatically for every row.

6.3 Notion Agent

The **Notion Agent** can take on multi-step jobs inside your workspace:

PROMPT

Look through my meeting notes from the last two weeks, find every action item assigned to me, and add each one to my Tasks database with a due date and a link back to the meeting.

PROMPT

Turn this brainstorm page into a Projects database with a row for each idea, and fill in a one-sentence summary and an estimated effort.

6.4 Custom Agents

Custom Agents run on their own: on a schedule or when something happens, such as a new database item or a message. They follow your plain-English instructions, use the sources and tools you allow (including Slack, Linear, and other apps via MCP), and log every run so you can review and undo changes. Typical uses: answering team questions, routing incoming requests, and writing weekly status updates.

> TIP
>
> Give agents narrow, specific jobs and limited access (“only the Support database and the #help channel”). Review their logs for the first week before trusting them fully.

CHAPTER 7

Sharing and Collaboration

7.1 Sharing a page

Click **Share** at the top right of any page:

- **Invite** people by email and choose their access: **Full access**, **Can edit**, **Can comment**, or **Can view**.
- **General access**: decide whether only invited people, everyone in your workspace, or anyone with the link can open it.
- **Publish** (the **Publish** tab in the Share menu): turn the page into a public website with **Notion Sites**, at a `notion.site` address or your own domain on paid plans.

Pages inherit sharing from their parent: share a parent page and everything inside it is shared too.

7.2 Teamspaces

On team plans, **Teamspaces** organize work by group (Marketing, Engineering…), each with its own members and permissions.

7.3 Working together

- **Comments:** select text and click **Comment**, or hover over a block and use its comment icon. Mention teammates with `@`.
- **Page history:** ••• menu, then **Version history**, to see and restore earlier versions. The history length depends on your plan.
- **Notifications:** the **Inbox** in the sidebar collects mentions, comments, and reminders.

> ⚠ WARNING
> Before publishing a page to the web, check the subpages inside it. They're published too, unless you change their settings.

CHAPTER 8

Connect Notion to Other Tools

8.1 Built-in connections

Notion connects with Slack, Google Drive, GitHub, Jira, Figma, and many more. Paste a link from those apps and choose **Paste as preview** for a live card. Manage connections under `Settings` › `Connections`.

Notion Mail and **Notion Calendar** are free companion apps that link your inbox and calendar to your Notion pages.

8.2 Connect AI tools with Notion MCP

Notion runs an official **MCP server**, so assistants like Claude, ChatGPT, Cursor, and Claude Code can search, read, create, and update your Notion pages and databases (see the *MCP* manual in this series):

- **Claude:** `Settings` › `Connectors`, find **Notion**, click **Connect**, and approve.
- **Claude Code:** `claude mcp add --transport http notion https://mcp.notion.com/mcp`, then `/mcp` to sign in.
- **Cursor and others:** add a remote server with the URL `https://mcp.notion.com/mcp`.

You sign in with OAuth, and the AI can only see pages *you* can see. Workspace owners can review and restrict these connections in `Settings` › `Connections`.

8.3 Automation tools and the API

Zapier, Make, and n8n all have Notion integrations (for example, "add every new form response to a Notion database"; see the *n8n* manual). For these, or for your own scripts, create a **connection** (Notion's developer docs call it an *internal connection*, formerly an *integration*):

CREATE AN API CONNECTION

1. **Open the developer portal** at notion.com/profile/integrations, or `Settings` › `Connections` › `Develop or manage integrations`.
2. **Create a new connection** for your workspace and give it a name.
3. **Copy the API token** from its configuration page. Treat it like a password.
4. **Grant access to pages.**
   Either add pages in the connection's **Content access** tab, or open a page, click •••, then **Connections**, and add your connection.
5. **Paste the token** into n8n, Zapier, or your script's credentials.

> **NOTE**
> A new connection can't see *anything* until you share pages with it. Sharing a parent page also shares its subpages. If an automation says "object not found," this is almost always why.

CHAPTER 9

Plans and Pricing

PLAN	PRICE PER MEMBER	GOOD FOR
Free	$0	Individuals: unlimited pages and blocks; limited file uploads and history; an AI trial
Plus	$10/month billed yearly ($12 monthly)	Small teams and power users: unlimited uploads, longer history, more guests
Business	$20/month billed yearly ($24 monthly)	Teams that want Notion AI and agents, SSO, and private teamspaces
Enterprise	Custom	Advanced security, admin controls, and AI data protections

From notion.com/pricing, October 2026. Students and teachers can often get Plus free with a school email.

CHAPTER 10

Tips and Troubleshooting

PROBLEM	TRY THIS
Can't find a page	Cmd / Ctrl + P to search; check **Trash** in the sidebar (deleted pages are kept for a while)
Database feels cluttered	Create views with filters instead of deleting data
Someone can't open a shared link	Check **Share** settings; they may need an invitation, or general access widened
Automation can't find my page	Share the page with the connection (••• › Connections)
Page is slow	Very large databases or embeds slow things down; split them or use filtered views
Want to work offline	Use the desktop or mobile app and mark key pages available offline

10.1 Keyboard shortcuts worth learning

SHORTCUT (MAC / WINDOWS)	ACTION
Cmd / Ctrl + N	New page
Cmd / Ctrl + P	Search
Cmd / Ctrl + K	Add a link
Cmd / Ctrl + Shift + L	Toggle dark mode
Cmd / Ctrl + </kbd>	Show or hide the sidebar
Cmd / Ctrl + D	Duplicate the selected block
Esc	Select the current block
Cmd / Ctrl + /	Turn the selected block into another type

CHAPTER 11

Keyboard Shortcuts and Slash Commands

Notion is much faster from the keyboard. On Windows and Linux, read `Cmd` as `Ctrl`. For block-type shortcuts, read `Option` as `Shift`.

IN THIS CHAPTER

- App-wide shortcuts
- Editing shortcuts
- Markdown-style typing shortcuts
- The `/` command menu

11.1 App-wide

Source: Notion Help Center, notion.com/help/keyboard-shortcuts, checked October 2026.

KEYS	ACTION
`Cmd` + `P` or `Cmd` + `K`	Open search or jump to a recent page
`Cmd` + `F`	Search inside the current page
`Cmd` + `N`	New page (desktop app)
`Cmd` + `T`	New Notion tab (desktop app)
`Cmd` + `Shift` + `N`	New Notion window (desktop app)
`Cmd` + click	Open a link in a new Notion tab
`Cmd` + `[` / `]`	Back / forward
`Cmd` + `Shift` + `U`	Go up one level in the page hierarchy
`Cmd` + `L`	Copy the page's link
`Cmd` + `Shift` + `L`	Toggle dark / light mode

Cmd + + / -	Zoom in / out

11.2 Editing

KEYS	ACTION
Shift + Enter	Line break inside a block
Esc	Select the current block (or clear the selection)
Cmd + A	Select the block your cursor is in
Cmd + D	Duplicate selected blocks
Cmd + Shift + arrow keys	Move selected blocks
Tab / Shift + Tab	Indent (nest) / un-nest
Cmd + /	Change type, colour, or move selected blocks (also edits many database rows at once)
Cmd + Enter	Open a page, tick a to-do, open or close a toggle
Cmd + Option + T	Expand or close all toggles
Cmd + Shift + H	Apply the last text or highlight colour
Cmd + B / I / U	Bold / italic / underline
Cmd + Shift + S	Strikethrough
Cmd + E	Inline code
Cmd + K (text selected)	Add a link
Cmd + Shift + M	Comment
Cmd + Option + 0–9 (Windows: Ctrl + Shift + 0–9)	0 text, 1–3 headings, 4 to-do, 5 bullets, 6 numbers, 7 toggle, 8 code, 9 page
Option / Alt + drag	Duplicate content by dragging

11.3 Type-to-format (Markdown shortcuts)

Type these at the start of a line:

TYPE	YOU GET
# + space	Heading 1 (## H2, ### H3)
- or * + space	Bulleted list
1. + space	Numbered list

`[]`	To-do checkbox
`>` + space	Toggle list
`"` + space	Quote
`---`	Divider
```` ``` ````	Code block
`**text**`, `*text*`, `` `text` ``, `~text~`	Bold, italic, code, strikethrough (inline)
`@`	Mention a person, page, or date
`[[`	Link to (or create) a page
`+`	Create a new sub-page inline
`:` + a word	Emoji, e.g. `:rocket`

11.4 The `/` menu

Type `/` anywhere and start typing to filter. Commands documented in the Help Center:

COMMAND	INSERTS
`/text`, `/page`, `/bullet`, `/num`, `/todo`, `/toggle`	Basic blocks
`/h1`, `/h2`, `/h3` (or `/#`, `/##`, `/###`)	Headings
`/div`, `/quote`, `/link`	Divider, quote, link to a page
`/mention`, `/date`, `/reminder`, `/equation`, `/emoji`	Inline items
`/image`, `/pdf`, `/book`, `/video`, `/audio`, `/file`, `/embed`, `/code`	Media
`/duplicate`, `/moveto`, `/delete`	Act on the current block
`/toc`, `/bread`, `/button`, `/template`, `/math`	Table of contents, breadcrumb, button, TeX
`/turn`, `/color` (e.g. `/blue`, `/blue background`, `/default`)	Change block type or colour

Database blocks (table, board, calendar, etc.) also appear when you type their names in the `/` menu.

CHAPTER 12

Formulas Reference

Formula properties calculate a value from other properties in the same database row. Notion's formula language (Formulas 2.0) is close to a spreadsheet's. Function names below were checked against Notion's formula syntax help page (notion.com/help/formula-syntax) in October 2026.

IN THIS CHAPTER

- How to write a formula
- The functions you'll actually use, by category
- Twelve ready-made formulas

12.1 Basics

Add a property, choose **Formula**, and click to edit. Refer to other properties by clicking them, or typing `prop("Name")`. Formulas can span several lines, and you can store intermediate values with `let`.

12.2 Functions by category

CATEGORY	FUNCTIONS	EXAMPLE
Logic	`if`, `ifs`, `and`, `or`, `not`, `empty`	`if(prop("Done"), "✅", "⏳")`
Comparison	`==`, `!=`, `>`, `<`, `>=`, `<=`	`prop("Score") >= 80`
Math	`+ - * / %`, `round`, `floor`, `ceil`, `abs`, `min`, `max`, `sum`, `sqrt`	`round(prop("Price") * 1.07 * 100) / 100`
Text	`length`, `lower`, `upper`, `contains`, `test`, `replace`, `replaceAll`, `split`, `join`, `repeat`, `format`, `formatNumber`, `style`, `unstyle`, `link`	`upper(prop("Code"))`
Dates	`now`, `today`, `dateAdd`, `dateSubtract`, `dateBetween`, `dateStart`, `dateEnd`, `formatDate`, `parseDate`, `timestamp`, `week`, `month`, `year`	`dateBetween(prop("Due"), today(), "days")`
Lists	`at`, `first`, `last`, `slice`, `sort`, `reverse`, `unique`, `map`, `filter`, `find`, `some`, `every`, `includes`	`prop("Tasks").filter(current.prop("Done")).length()`
Variables	`let`, `lets`	`let(d, dateBetween(prop("Due"), today(), "days"), d + " days")`
Convert	`toNumber`, `format`	`toNumber(prop("Text number"))`

12.3 Twelve ready-made formulas

DAYS UNTIL DUE

```
dateBetween(prop("Due"), today(), "days")
```

OVERDUE FLAG

```
if(and(not(prop("Done")), prop("Due") < today()), "🔴 Overdue", "")
```

PROGRESS BAR FROM A ROLLUP PERCENTAGE (0–1)

```
let(p, round(prop("Progress") * 10), repeat("▓", p) + repeat("░", 10 - p))
```

STATUS EMOJI

```
ifs(prop("Status") == "Done", "✅", prop("Status") == "In progress", "🟡", "⚪")
```

FULL NAME

```
prop("First") + " " + prop("Last")
```

PRICE WITH TAX

```
round(prop("Price") * 1.07 * 100) / 100
```

WEEK NUMBER LABEL

```
"Week " + format(week(prop("Date")))
```

AGE IN YEARS

```
dateBetween(today(), prop("Birthday"), "years")
```

COUNT OF COMPLETED RELATED TASKS

```
prop("Tasks").filter(current.prop("Done")).length()
```

NEXT REVIEW DATE (30 DAYS AFTER LAST)

```
dateAdd(prop("Last reviewed"), 30, "days")
```

COLOURED PRIORITY

```
style(prop("Priority"), if(prop("Priority") == "High", "red", "gray"))
```

WORD COUNT OF A TEXT PROPERTY

```
prop("Notes").split(" ").filter(current != "").length()
```

TIP

If a formula shows an error, hover over the red underline. Usually it's a type mismatch, such as comparing text with a number. Use `toNumber()` or `format()` to convert. You can also ask Notion AI to "write a formula that…" if your plan includes AI.

CHAPTER 13

Ten Templates to Build Yourself

Building templates yourself teaches you more than duplicating them. Each recipe lists the properties and views to create.

TEMPLATE	DATABASE PROPERTIES	VIEWS
Habit tracker	Date (date), one checkbox per habit, Score (formula: count ticked)	Calendar; table this week
Reading list	Title, Author (text), Status (status), Rating (select ★–★★★★★), Finished (date), Notes	Board by Status; gallery with covers
Personal CRM	Name, Company, Email, Last contacted (date), Next follow-up (formula: +30 days), Tags	Table sorted by Next follow-up
Content calendar	Title, Channel (multi-select), Publish date, Status, Owner (person), Link (URL)	Calendar by Publish date; board by Status
Meeting notes	Title, Date, Attendees (person), Project (relation), Action items (to-dos in the page)	List sorted by date; filter “this week”
Recipe book	Name, Cuisine (select), Time (number, minutes), Ingredients (text), Rating	Gallery; filter Time ≤ 30
Job applications	Company, Role, Stage (status), Applied (date), Contact, Salary range, Days since applied (formula)	Board by Stage
Budget tracker	Item, Amount (number, $), Category (select), Date, Type (Income/Expense)	Table grouped by Category with Sum; chart view if available
Team wiki	Page (title), Owner (person), Verified (checkbox), Last edited time	List; filter Verified = false
Travel planner	Place, Date, Booking ref, Cost, Type (Flight/Hotel/Activity), Map link	Timeline; table grouped by Type

BUILD ANY OF THEM

1. **Create a full-page database.**
   Type `/database` and choose *Full page*.
2. **Add the properties** from the table above.

3. **Add the views.**
   Click **+** next to the view tabs.

4. **Make a page template.**
   Use the arrow next to **New** → **+ New template**, and add the headings and checklists every entry should have.

5. **Add five real entries** and adjust anything that feels awkward.

CHAPTER 14

The Notion API for Beginners

The Notion API lets scripts and tools like n8n read and write your pages. Official docs: developers.notion.com.

FIRST API CALL

1. **Get a token.**
   Create an internal integration at notion.so/profile/integrations and copy its secret. Notion's Help Center also describes personal access tokens: turn on **Developer Mode** in Settings, then open the developer section of the sidebar. Use whichever your workspace offers.

2. **Share a page with it.**
   Open the page, then use ••• → **Connections** → add your integration. The API can only see pages you share this way.

3. **Find the database ID.**
   It's the long ID in the database's URL.

4. **Query it.**

TERMINAL

```
curl -X POST https://api.notion.com/v1/databases/DATABASE_ID/query \
  -H "Authorization: Bearer $NOTION_TOKEN" \
  -H "Notion-Version: 2022-06-28" \
  -H "Content-Type: application/json"
```

> **NOTE**
> Notion versions its API with the `Notion-Version` header, and newer versions introduce changes such as data sources. Check the docs for the current version before you build anything long-lived.

> **DANGER**
> The integration secret gives access to everything shared with it. Keep it in an environment variable or a secret store, and share only the pages the integration needs.

CHAPTER 15

Database Deep Dive: Every Property, View, and Filter

Databases are where Notion gets powerful. This chapter is a reference you can return to every time you build one.

IN THIS CHAPTER

- Every property type and when to use it
- Relations and rollups, step by step
- Views, filters, sorts, and grouping
- Automations and buttons

15.1 Property types

PROPERTY	HOLDS	USE IT FOR
Title	The page name (every database has one)	Task name, book title
Text	Free text	Notes, short descriptions
Number	Numbers with a format (%, $, bar, ring)	Prices, scores, progress
Select	One option from a list	Priority, category
Multi-select	Several options	Tags
Status	To-do / In progress / Complete groups	Workflow stages
Date	A date or date range, optional time and reminder	Due dates, events
Person	Workspace members	Owner, assignee
Files & media	Uploads or links	Attachments, covers
Checkbox	Yes/no	Done, verified
URL / Email / Phone	Clickable contact data	Links, contacts
Formula	A calculated value (Chapter 12)	Days left, labels

Relation	Links to rows in another database	Tasks ↔ Projects
Rollup	A summary of related rows	% of tasks done
Created time / by, Last edited time / by	Automatic metadata	Auditing
Unique ID	An auto-incrementing number with an optional prefix	Ticket numbers like `BUG-42`
Button	Runs actions when clicked	“Mark done and archive”

15.2 Relations and rollups

PROJECTS ↔ TASKS

1. **Make two databases:**
   Projects and *Tasks*.
2. **In Tasks, add a Relation property** pointing to Projects. Turn on **Show on Projects** so the link goes both ways.
3. **Link a few tasks to projects** by clicking the relation cell.
4. **In Projects, add a Rollup.**
   Choose Relation = Tasks, Property = Done (checkbox), and Calculate = **Percent checked**.
5. **Format it** as a bar or ring. Now each project shows its progress automatically.

15.3 Rollup calculations

CALCULATION	RESULT
Show original	The related values themselves
Count all / values / unique	How many related rows or values
Count empty / not empty	Gaps in the data
Percent empty / not empty / checked	Completion percentage
Sum, Average, Median, Min, Max, Range	Number summaries
Earliest / Latest date, Date range	Date summaries

15.4 Views

VIEW	BEST FOR
Table	Spreadsheet-style editing
Board	Kanban columns by Status or Select
Calendar	Anything with a date
Timeline	Projects with start and end dates
List	Clean, document-style lists
Gallery	Visual cards with cover images
Chart	Bar, line, and donut charts (on plans that include them)
Form	Collect entries from people (on plans that include forms)

15.5 Filters, sorts, and groups

PROPERTY TYPE	FILTER CONDITIONS YOU'LL SEE
Text	is, is not, contains, does not contain, starts with, ends with, is empty, is not empty
Number	=, ≠, >, <, ≥, ≤, is empty, is not empty
Select / Status	is, is not, is empty, is not empty
Multi-select	contains, does not contain, is empty, is not empty
Date	is, is before, is after, is on or before, is on or after, is within (past week, next month…), is empty
Checkbox	is checked, is not checked
Person	contains, does not contain, *Me*

Advanced filters combine rules with *And*/*Or* groups. A classic "My open tasks" view is: Assignee *contains* Me **and** Status *is not* Done. Sort by Due ascending. Group by Project.

15.6 Buttons and automations

A **button** (`/button`) can insert blocks, add or edit database pages, open a page, or send notifications. **Database automations** (the ⚡ icon on a database, on plans that include them) run actions when a property changes, for example "When Status is set to Done, set Completed date to today." Availability depends on your plan.

CHAPTER 16

Organise Your Whole Workspace

A tidy structure makes everything easier to find. This chapter gives you one proven layout to copy.

SET UP A SIMPLE PARA WORKSPACE

1. **Create four top-level pages:**
   Projects, Areas, Resources, Archive.
2. **Projects:**
   one database of active projects, each with a goal and a deadline.
3. **Areas:**
   ongoing responsibilities with no end date, such as Health, Finances, and Home.
4. **Resources:**
   reference material, notes, and saved articles.
5. **Archive:**
   anything finished or inactive. Move pages here rather than deleting them.
6. **Create a Home dashboard** (Chapter 5) with linked views of "My open tasks" and "Active projects."
7. **Favourite the Home page** so it's always at the top of your sidebar.

- [ ] Every database has an owner and a clear purpose
- [ ] Use linked views instead of copying databases
- [ ] Use templates for anything you create more than twice
- [ ] Do a weekly review: archive finished projects, clear your inbox page

- [ ] Use consistent icons and emoji for scanning

> **TIP**
> You do not need to adopt every habit at once. Pick the two that would fix your biggest annoyance today, such as a messy sidebar or duplicated databases, and practice them for a couple of weeks. Add one more habit each month and your workspace stays tidy without a big cleanup weekend.

CHAPTER 17

Troubleshooting and FAQ

PROBLEM	FIX
Can't find a page	`Cmd` + `P` search. Check **Trash** at the bottom of the sidebar (pages stay there for 30 days by default)
A page disappeared after a teammate edited it	Open ••• → **Version history** (history length depends on plan)
Someone can't see a page	Click **Share** and check their access level, and whether the parent page restricts it
Database is slow	Add filters to views, cut down on complex rollups and formulas, and split very large databases
Formula error	Hover over the red underline. Usually a type mismatch, so use `toNumber()` or `format()`
Relation doesn't show on the other side	Turn on **Show on [other database]** in the relation settings
Import from another app looks wrong	Try `Settings` › `Import` with a different format (CSV, Markdown, HTML)
Offline edits didn't sync	Reconnect and keep the app open. Check for a sync-conflict notice

Is my data private? Pages are private until you share them. Workspace admins on team plans may have additional access. Read Notion's current privacy and security pages for details.

Can I export everything? Yes. `Settings` › `General` › `Export all workspace content` (under *Workspace*) exports Markdown & CSV, HTML, or PDF (PDF depends on plan).

Does Notion work offline? The desktop and mobile apps can work with pages offline, but how much is available offline has changed over time and varies by plan. Check Notion's help centre for the current behaviour.

CHAPTER 18

Notion AI Prompt Cookbook

Prompts for Notion AI (Chapter 6), on plans that include it. Press `Space` on an empty line, or select text and choose **Ask AI**.

GOAL	PROMPT
Summarise a page	"Summarise this page in 5 bullets and list open questions."
Meeting notes → actions	"Extract action items with owner and due date as a to-do list."
Draft from outline	"Turn these bullets into a one-page project brief."
Rewrite	"Make this clearer and shorter. Keep my tone."
Translate	"Translate this page to Spanish, keeping formatting."
Brainstorm	"Give 15 ideas for [x], grouped by theme."
Database fill	Use an **AI autofill** property: "Summarise the page in one sentence" or "Extract the company name."
Search the workspace	"What did we decide about [topic] last month? Cite the pages."
Weekly update	"Write a weekly status update from the Done tasks in this database."
Template	"Create a reusable template for [weekly review] with headings and checklists."

> **TIP**
> Ask Notion AI to **cite pages** when it answers from your workspace, then click the citations to check them.

CHAPTER 19

Moving to Notion From Other Apps

IMPORT YOUR OLD NOTES

1. **Open** `Settings` › `Import` (desktop or web; you can also type `/` on a page and search for the importer). Notion lists the supported sources, such as Evernote, Google Docs, Confluence, Trello, Asana, Word, Markdown, CSV, and HTML. The list varies over time.
2. **Start with one small notebook or folder** as a test.
3. **Check formatting, images, and links** on a few pages.
4. **Import the rest,** then move pages into your PARA structure (Chapter 16).
5. **Keep the old app read-only for a month** before deleting anything.

FROM	TIP
Google Docs	Imports as pages. Comments and suggestions may not come across
Evernote	Notebooks become pages. Tags may need re-creating as a multi-select
Trello / Asana	Boards become databases. Check that due dates and assignees mapped correctly
Spreadsheets	Import CSV as a database, then change property types (date, select, number)
Markdown folders	Zip the folder and import. Linked files may need re-linking

CHAPTER 20

Project: A Simple CRM for Clients and Leads

A CRM (customer relationship manager) tracks who you know, where each deal stands and what to do next. This project builds one in about an hour with three linked databases. It works for freelancers, small businesses and job seekers, where the "deals" are applications.

- **Databases:** Companies, Contacts and Deals, plus an optional Interactions log.
- **Key skills:** relations, rollups, formulas, board views, filtered linked views and templates.
- **Result:** a Pipeline board, a "follow up today" list, and a page for each company showing everything about it.

20.1 Step 1: Create the databases

Make a page called **CRM**. Inside it, type `/database` and choose a full-page or inline database. Make three of them:

DATABASE	PROPERTIES TO ADD
Companies	Name (title), Website (URL), Industry (select), Size (select), Notes (text)
Contacts	Name (title), Email (email), Phone (phone), Role (text), Company (relation → Companies), Last contacted (date), Next follow-up (date)
Deals	Deal (title), Company (relation → Companies), Contact (relation → Contacts), Stage (status), Value (number, currency), Expected close (date), Owner (person)

When you create each **relation**, switch on the option to show it on the other database too. Companies then automatically lists its Contacts and Deals.

20.2 Step 2: Set up the pipeline stages

Edit the **Stage** status property in Deals. Status properties have three groups: To-do, In progress and Complete. Arrange your options like this:

GROUP	OPTIONS
To-do	Lead
In progress	Contacted, Meeting, Proposal sent, Negotiating
Complete	Won, Lost

20.3 Step 3: Add rollups and formulas

WHERE	ADD	SETTINGS
Companies	**Total deal value** (rollup)	Relation: Deals. Property: Value. Calculate: Sum
Companies	**Deal count** (rollup)	Relation: Deals. Calculate: Count all
Contacts	**Follow-up due** (formula)	`if(empty(prop("Next follow-up")), false, prop("Next follow-up") <= now())`
Deals	**Days to close** (formula)	`if(empty(prop("Expected close")), "", format(dateBetween(prop("Expected close"), now(), "days")) + " days")`

> **TIP**
> Formulas are case-sensitive about property names. If a formula shows an error, retype the property name using the property picker inside the formula editor.

20.4 Step 4: Build the views

VIEW	DATABASE	TYPE	SETUP
Pipeline	Deals	Board	Group by Stage. Hide the Won and Lost columns, or move them to the end
Closing this month	Deals	Table	Filter: Expected close is within this month. Sort by Value, descending
Follow up today	Contacts	List	Filter: Follow-up due is checked. Sort by Next follow-up
By company	Contacts	Table	Group by Company
Won	Deals	Table	Filter: Stage is Won. Show a Value sum in the footer calculation

20.5 Step 5: Templates for speed

1. In **Deals**, click the arrow next to **New** and create a template named "New deal". Pre-set Stage to **Lead**, and add a page body with these headings: *Context*, *Needs*, *Next step*, *Notes*.
2. In **Contacts**, create a "Met at event" template with a checklist: send thank-you, connect online, set a follow-up date.
3. Set each template as the default for its database, so every new item starts filled in.

20.6 Step 6: The daily routine (5 minutes)

1. Open **Follow up today** and contact each person. Update **Last contacted**, then set a new **Next follow-up**.
2. Open **Pipeline** and drag any cards that moved forward.
3. On Fridays, open **Closing this month** and update the expected dates honestly.

20.7 Variations

USE CASE	CHANGE
Job search	Companies = employers, Deals = applications. Stages: Applied, Screen, Interview, Offer, Rejected
Fundraising	Deals = asks. Value = pledge amount. Stages: Prospect, Asked, Pledged, Received
Freelance	Add an **Invoices** database related to Deals with Amount, Sent and Paid date

CHAPTER 21

Project: A Team Wiki People Actually Use

A wiki fails when nobody can find anything or nobody trusts it to be current. This structure fixes both problems.

21.1 Structure

TOP-LEVEL PAGE	WHAT GOES IN IT
Start here	What the team does, who's who, how to ask for help, and links to the 10 most used pages
How we work	Meetings, communication norms, tools and access
Processes	One page per repeatable process (onboarding, releases, expenses)
Projects	Linked view of the Projects database (see *Build a Project Tracker*)
Decisions	Database: Decision, Date, Owner, Status, Context, Link
Reference	Glossary, templates and brand assets

21.2 Build it

1. Create a teamspace for the team (or one top-level page if you're on a personal plan) and add the six pages above.
2. On **Start here**, add `/toc` for a table of contents, and a callout (`/callout`) saying who maintains the wiki.
3. Make **Processes** a database instead of loose pages. Give it the properties Owner (person), Last reviewed (date), Status (select: Current, Needs review, Outdated) and Area (select).

4. Add a formula property **Stale** to Processes: `dateBetween(now(), prop("Last reviewed"), "days") > 90`
5. Create a view **Needs review**, filtered to Stale is checked or Status is Needs review, and sorted by Last reviewed.
6. Give each process page the same template: *Purpose*, *When to use*, *Steps*, *Owner*, *Related*.
7. Use **synced blocks** for text that appears on many pages, such as a support contact. Edit it once and it updates everywhere.

21.3 Keep it alive

- [ ] Every page has one named owner
- [ ] The owner reviews their pages when the **Needs review** view shows them, and updates **Last reviewed**
- [ ] New questions in chat are answered with a link to a wiki page. If none exists, someone writes one
- [ ] Outdated pages are moved to an **Archive** page rather than deleted, so their links still work
- [ ] Use Notion AI or search to find duplicates once a quarter, and merge them

CHAPTER 22

Project: The Weekly Review System

A weekly review is 30 minutes on Friday or Sunday to close loops and plan the next week. This Notion setup makes it repeatable.

22.1 Databases

DATABASE	PROPERTIES
Tasks (reuse yours)	Name, Status, Due (date), Priority (select), Area (select)
Weekly reviews	Week (title), Date (date), Wins (text), Energy (select: Low/OK/High), Focus next week (text)

22.2 The review template

In **Weekly reviews**, make a template with the sections below, and set it to **repeat weekly** on your review day so it appears automatically.

WEEKLY REVIEW TEMPLATE BODY

```
## 1. Clear (10 min)
- [ ] Empty email/chat inbox into Tasks
- [ ] Process notes and loose papers
- [ ] Clear downloads/desktop

## 2. Review (10 min)
<linked view: Tasks — Done this week>
<linked view: Tasks — Overdue>
- What went well?
- What didn't, and why?

## 3. Plan (10 min)
<linked view: Tasks — Due next 7 days>
- Top 3 outcomes for next week:
  1.
  2.
  3.
```

To add the linked views, type `/linked` inside the template and pick **Tasks**. Then set a filter on each one:

LINKED VIEW	FILTER
Done this week	Status is Done, and the last-edited date is within the past week (add a **Last edited time** property to Tasks first)
Overdue	Due is before today, and Status is not Done
Due next 7 days	Due is within the next week

22.3 Make it stick

- Block the time in your calendar as a recurring event.
- Keep the same order every week. The routine matters more than the tool.
- Every 4 weeks, read your last four reviews, and ask Notion AI: “What patterns do you see in my wins and problems across these reviews?”

CHAPTER 23

Automations, Buttons, and Reminders: Recipes

Notion can do small automations without outside tools. What's available depends on your plan. Some database automations need a paid plan, so check notion.com/pricing.

GOAL	TOOL	RECIPE
One-click new task with defaults	Button (`/button`)	Action: Add page to Tasks, with Status = To do, Due = today, and Assignee = the person who clicked
Mark several items done	Button on a database page	Action: Edit pages in Tasks, filtered to the current project, setting Status = Done
Remind me before a deadline	Date reminder	Click a date property value and set a reminder. Notion notifies you
Recurring checklist	Repeating template	Database template → set to repeat daily, weekly or monthly
Notify the team when a status changes	Database automation	Trigger: Status set to *Needs review*. Action: send a notification, or a Slack message if connected
Fill a date when done	Database automation	Trigger: Status set to *Done*. Action: set Completed = today
Anything across apps	Integrations	Use the Notion API, or n8n (see the n8n manual)

> **NOTE**
>
> Buttons and automations act with your permissions, so test them on a copy of the database first. An "edit pages" action can change many pages at once.

CHAPTER 24

Notion for Students

NEED	SETUP
Course hub	A **Courses** database (Name, Term, Instructor, Schedule) with a page per course containing notes and a linked view of Assignments
Assignments	Name, Course (relation), Due, Status, Grade (number), Weight (number). Board grouped by Status, and calendar by Due
Grade calculator	In Courses, a rollup of Grade × Weight. Or add a formula in Assignments, `prop("Grade") * prop("Weight")`, then roll up the sum
Lecture notes	Use a template with headings *Key ideas*, *Questions* and *Summary*. Afterwards ask Notion AI: "Make 10 quiz questions from these notes"
Reading tracker	Title, Author, Course, Pages, Status, Key quote
Exam countdown	A formula: `format(dateBetween(prop("Exam date"), now(), "days")) + " days left"`

> **TIP**
>
> Notion offers education pricing for eligible students and teachers. Check notion.com/pricing for the current terms. Don't rely on any price you read in a manual, this one included.

Quick Reference

Insert anything: `/` · **Link a page:** `[[` · **Mention a person, page, or date:** `@` · **Ask AI:** Space on an empty line

Formatting: `#` heading · `-` bullet · `[]` to-do · `>` toggle · `---` divider

Databases: properties = fields · views = Table / Board / Calendar / Timeline / Gallery / Chart / Form · filter, sort, group per view · relation + rollup to connect databases

Share: Share › invite or publish · sharing a parent shares its subpages

AI connections: Notion MCP `https://mcp.notion.com/mcp` · API: create a connection, then share pages with it

Glossary

Block	Any single piece of content on a page, such as a paragraph, heading, image, or to-do.
Button	A block that performs set actions, like adding a pre-filled task, when clicked.
Connection	A link between Notion and another app or script, which needs pages shared with it. Formerly called an integration.
Custom Agent	A Notion AI agent that runs on a schedule or trigger to do a recurring job.
Dashboard	A page that collects important views and links in one place.
Database	A collection of pages that share the same properties, viewable in many layouts.
Filter	A rule that shows only database items that match, such as Status is In progress.
Formula	A property that calculates its value from other properties.
Linked view	A view of a database placed on a different page.
Markdown shortcut	Typing symbols like `#` or `-` to format text instantly.
MCP	Model Context Protocol, the standard that lets AI apps connect to Notion and other tools.
Notion Agent	Notion AI's ability to carry out multi-step tasks in your workspace.
Notion Sites	Notion's feature for publishing pages as public websites.
Page	A document in Notion that can contain blocks and other pages.
Property	A field on a database item, such as Date, Status, or Person.
Relation	A property that links items in one database to items in another.

Rollup	A property that summarizes related items, such as counting tasks or averaging values.
Teamspace	A shared area of a workspace for a specific team, with its own members.
Template	A reusable starting layout for a page or database item.
View	One way of displaying a database: table, board, calendar, timeline, and more.
Workspace	Your whole Notion environment, containing all your pages and members.
