

A BEGINNER'S MANUAL

Notion

One workspace for notes, docs, projects, and databases, with AI built in. A complete beginner's manual

For complete beginners • October 2026 edition • Print edition · US Letter

GUIDES FOR EVERYTHING

Notion

One workspace for notes, docs, projects, and databases, with AI built in. A complete beginner's manual

Notion is a flexible workspace where you write notes and documents, manage projects and to-do lists, build simple databases, and share it all with others. Think of it as digital LEGO: a handful of simple pieces (pages, blocks, and databases) that snap together into almost anything, from a personal journal to a whole company wiki.

This manual assumes you have never used Notion. It starts with the screen and the building blocks, then teaches databases in depth: every property type, every view, filters, relations, rollups, and Formula 2.0 with more than twenty worked examples. Along the way you'll build eleven real systems step by step, from a habit tracker and a budget to a CRM and a team wiki. Later chapters cover Notion AI, AI Meeting Notes, Custom Agents, forms, Notion Sites, Notion Calendar, sharing and permissions, import and export, the API, the Notion MCP server for AI assistants, the apps, plans and prices, and a large troubleshooting table.

HOW TO READ THIS MANUAL

- **Tip** — a shortcut or good habit.
- **Note** — useful background.
- **Warning** — easy to get wrong.
- **Danger** — can lose data, money, or access.
- `$ command` — text you type, exactly as shown.
- Settings › Privacy — a menu path to click.

New words appear in **bold** the first time and are collected in the Glossary at the back.

Facts, prices, and menu paths were checked against official documentation in October 2026. Software changes quickly — when something on screen doesn't match, trust the product's current docs.

Contents

01 Welcome to Notion 10

1.1 What people use Notion for 10
1.2 What Notion is not 11
1.3 Six words to know 11
1.4 Get started 11
1.5 The Notion screen 12
1.6 Your first page in two minutes 12
1.7 How to use this manual 13

02 Finding Your Way Around 14

2.1 Workspaces 14
2.2 The sidebar 14
2.3 Private, Shared, and Teamspaces 15
2.4 Favorites, Recents, and Library 16
2.5 Search 17
2.6 The Inbox 17
2.7 The parts of a page 17
2.8 Trash 18
2.9 Settings 18

03 Pages and Blocks 19

3.1 Blocks: the LEGO bricks 19
3.2 The three editing tools 20
3.3 Every kind of block 20
3.4 Moving and nesting blocks 22
3.5 Columns 22
3.6 Colors and highlights 22
3.7 Toggles and toggle headings 23
3.8 Callouts 23
3.9 Simple tables vs databases 23
3.10 Synced blocks 23
3.11 Pages inside pages 24
3.12 Worked example: a recipe page 24

04 Writing Faster 25

4.1 The slash command 25
4.2 Markdown shortcuts 26
4.3 Styling text with the keyboard 27
4.4 Emoji 28
4.5 Mentions with @ 28
4.6 Links with [[and + 28
4.7 Backlinks 29
4.8 Comments and suggestions 29
4.9 Word count 29
4.10 Worked example: clean up messy notes in two minutes 29

05 Pages vs Databases 31

5.1 The short answer 31
5.2 A simple test 31
5.3 How a database is built 32
5.4 Full-page vs inline databases 32
5.5 Create a database 33
5.6 Data sources 33
5.7 Linked views 33
5.8 Duplicate or lock a database 34

06 Database Properties 35

6.1 Create a database 35
6.2 Property types 36
6.3 Adding and editing properties 37
6.4 The important types, in more detail 37
6.5 Conditional color 38
6.6 Let AI fill in properties 39
6.7 Page layouts 39
6.8 Worked example: a property plan 39

07 Database Views 40

7.1 Views: the same data, many ways 40
7.2 Create and manage views 41
7.3 How pages open 42
7.4 Each view in detail 42
7.5 Dashboards 44

7.6 Worked example: one database, four views 45

08 **Filters, Sorts, and Groups** 46

8.1 Filters 46
8.2 Sorts 48
8.3 Groups 48
8.4 Search inside a database 48
8.5 Recipes for common views 48

09 **Relations, Rollups, and Sub-items** 50

9.1 Relations and rollups, simply 50
9.2 Create a relation 50
9.3 Rollups 51
9.4 Sub-items 52
9.5 Dependencies 52
9.6 Worked example: a tiny book club 52

10 **Formulas** 54

10.1 Create a formula 54
10.2 The building blocks 55
10.3 Data types 55
10.4 Useful functions at a glance 56
10.5 Worked examples: dates 56
10.6 Worked examples: text and numbers 57
10.7 Worked examples: lists, people, and relations 58
10.8 Let Notion AI write it 59
10.9 Where else formulas work 60
10.10 Fixing common formula errors 60

11 **Templates, Buttons, and Automations** 61

11.1 Database templates 61
11.2 Buttons 62
11.3 Database automations 63
11.4 What each plan allows 64

12 **Build a Project Tracker** 66

12.1 The plan 66
12.2 Build it 66
12.3 Make it work for you 67

12.4 Automate the busywork 68
12.5 A weekly routine 68

13 A Personal Dashboard 69
13.1 Add quick-capture buttons 70
13.2 Ideas for sections 70
13.3 Dashboard views 70

14 Recipes for Your Own Life 71
14.1 Recipe 1: a second brain (PARA) 71
14.2 Recipe 2: a reading list 72
14.3 Recipe 3: a habit tracker 73
14.4 Recipe 4: a budget tracker 73
14.5 Recipe 5: a job application tracker 74

15 Recipes for Work and Teams 75
15.1 Recipe 6: a simple CRM 75
15.2 Recipe 7: a content calendar 76
15.3 Recipe 8: a team wiki 76
15.4 Recipe 9: a meeting notes system 77
15.5 Recipe 10: a shared request queue 78
15.6 Recipe 11: the project tracker 78

16 Notion AI 79
16.1 What's included 79
16.2 Ways to use Notion AI 80
16.3 Notion Agent 80
16.4 Choosing a model 81
16.5 Personalize your Agent 81
16.6 Skills 82
16.7 Chat tips 82
16.8 Prompts that work well 82

17 AI Meeting Notes and Enterprise Search 83
17.1 AI Meeting Notes 83
17.2 Enterprise Search 85
17.3 Research mode 85

18 Custom Agents and Notion Credits 86

18.1 Notion Agent vs Custom Agents 86
18.2 Build your first Custom Agent 87
18.3 Triggers 87
18.4 Access and tools 87
18.5 Models 88
18.6 Safety by design 88
18.7 Notion credits 88
18.8 Claude agents in Notion (beta) 89
18.9 Agent ideas 89

19 **Forms** 90
19.1 Create a form 90
19.2 Questions and properties 91
19.3 Share your form 91
19.4 Form ideas 92

20 **Sharing, Permissions, and Guests** 93
20.1 Sharing a page 93
20.2 Access levels 94
20.3 General access 94
20.4 Members, admins, owners, and guests 95
20.5 Groups 95
20.6 Database permissions by person 95
20.7 Stop sharing 95
20.8 Working together 96

21 **Notion Sites** 97
21.1 Publish a site 97
21.2 Site settings 97
21.3 Customize your site (paid plans) 98
21.4 Plans and domains 98

22 **Notion Calendar (and Notion Mail)** 100
22.1 Get Notion Calendar 100
22.2 Show a Notion database on your calendar 101
22.3 Meetings and notes 101
22.4 Mobile widgets 101
22.5 What happened to Notion Mail? 101

23 Import, Export, and Backups 103

23.1 Import 103

23.2 Export a page 104

23.3 Back up your whole workspace 105

23.4 Recovery 105

24 Connect Notion to Other Tools 106

24.1 Built-in connections 106

24.2 Link previews and embeds 107

24.3 Popular connections 107

24.4 No-code automation tools 107

25 The Notion API: A Beginner Example 109

25.1 Key words 109

25.2 Step 1: create a connection 110

25.3 Step 2: test the token 110

25.4 Step 3: add an item to a database 111

Quick Reference 129

Glossary 130

CHAPTER 1

Welcome to Notion

Notion is one app that can replace a notebook, a word processor, a to-do list, a spreadsheet, and a simple website builder. You don't need to learn all of it at once. Most people start with a single page of notes and grow from there, one small piece at a time.

IN THIS CHAPTER

- What Notion is good for, and what it isn't
- The six words you need to know before you start
- Creating your account and workspace
- Finding your way around the screen
- How to use this manual

1.1 What people use Notion for

- **Notes and journals**: class notes, meeting notes, daily logs.
- **Documents and wikis**: how-to guides, company handbooks, recipes.
- **Task and project management**: to-do lists, Kanban boards, content calendars.
- **Databases**: reading lists, client lists (a simple CRM), inventories, habit trackers.
- **Websites**: publish any page to the web with Notion Sites.
- **Forms**: collect sign-ups, requests, and survey answers straight into a database.
- **AI help**: write, summarize, answer questions about your workspace, take meeting notes, and automate busywork.

1.2 What Notion is not

Notion is a great all-rounder, but it's honest to say where it isn't the best tool:

IF YOU NEED...	CONSIDER INSTEAD	WHY
Heavy number crunching	A spreadsheet (Excel, Google Sheets)	Notion formulas work per row, not across a grid
Pixel-perfect print layouts	A word processor or design tool	Notion pages are built for screens
A huge public website	A website builder	Notion Sites suits simple sites best
Real-time chat	Slack, Teams	Notion has comments, not chat rooms

Many people use Notion *alongside* these tools, and Notion connects to most of them (Chapter 24).

1.3 Six words to know

You'll meet these words on every page of this manual. Don't worry about memorizing them; they'll become natural quickly.

WORD	PLAIN-ENGLISH MEANING
Workspace	Your whole Notion space: every page, every member, every setting
Page	A document. It can hold text, images, and other pages
Block	One piece of content on a page, such as a paragraph or an image
Database	A collection of pages that share the same fields, shown as a table, board, calendar, and more
Property	One field on a database item, such as a due date or a status
View	One way of looking at a database, with its own filters and layout

1.4 Get started

CREATE YOUR ACCOUNT

1. **Go to notion.com** and click **Get Notion free**, or download the desktop and mobile apps from notion.com/download.
2. **Sign up** with your email, Google, or Apple account.
3. **Choose how you'll use it**
   for yourself, with a team, or for school. This just picks starter templates.

4. **Name your workspace.**
   A **workspace** is your whole Notion account space; you can create more later (for example, one personal, one for work).

5. **Look around before deleting anything.**
   Notion usually adds a few starter pages. Read them: they're short tutorials, and you can delete them later.

> **TIP**
> Students and teachers can get the **Plus** plan free by signing up with a school email address. Thousands of school domains qualify, not just ones ending in .edu. See Chapter 28 for all the plans.

1.5 The Notion screen

AREA	WHAT IT IS
Sidebar (left)	Your pages in sections: **Teamspaces** (shared), **Private** (just you), and **Shared** (pages others shared with you); plus Search, Home, Inbox, and Settings
Page (center)	Whatever you're working on
Top bar	The page's location (its "breadcrumb"), **Share**, comments, updates, and the ••• menu
Notion AI	The AI face at the bottom right, or press `Space` on an empty line

The next chapter walks through each of these areas in detail.

> **TIP**
> Press `Cmd` + `P` (Mac) or `Ctrl` + `P` (Windows) to search everything. It's the fastest way to jump to any page. `Cmd`/`Ctrl` + `K` opens the same search.

1.6 Your first page in two minutes

MAKE A PAGE

1. **Click New page** in the sidebar (or press `Cmd`/`Ctrl` + `N`).
2. **Type a title**, such as "My first page".
3. **Press Enter** to move into the page body and start typing.
4. **Type** `/todo` and press Enter to add a checkbox. Write "Learn Notion basics".

5 **Close the page.**
There's no Save button: Notion saves every keystroke automatically.

> **NOTE**
> Notion stores everything in the cloud, so your pages appear on every device where you sign in. Notion also keeps its own backups. Chapter 23 shows how to make your own copies too.

1.7 How to use this manual

- **Chapters 1–4** cover the basics: the screen, pages, blocks, and writing fast.
- **Chapters 5–11** teach databases from the ground up, including views, filters, relations, formulas, and automations.
- **Chapters 12–15** are hands-on builds: follow the steps and you'll end up with working systems.
- **Chapters 16–18** cover Notion AI, meeting notes, and agents.
- **Chapters 19–28** cover forms, sharing, websites, the calendar, moving data in and out, connections, the API, MCP, the apps, and plans.
- **Chapters 29–30** are reference: shortcuts and troubleshooting.

- [ ] I have a Notion account and a workspace
- [ ] I can find the sidebar, the page area, and the Share button
- [ ] I made a page with a to-do checkbox
- [ ] I know `Cmd`/`Ctrl` + `P` opens search

CHAPTER 2

Finding Your Way Around

Before you build anything, it helps to know where things live. This chapter is a guided tour of the workspace: the sidebar, Home, search, the Inbox, teamspaces, and the parts of a page.

IN THIS CHAPTER

- Workspaces, and how to switch between them
- The sidebar: tabs, sections, Library, Favorites, and Trash
- Home, Search, and the Inbox
- Teamspaces, and Private vs Shared pages
- The parts of a page, and the ••• menu

2.1 Workspaces

A **workspace** is a self-contained Notion world with its own pages, members, settings, and plan. You can belong to several. A common setup is one personal workspace and one for your job.

- **Switch workspaces:** click the workspace name in the sidebar to open the **workspace switcher**. From there you can also create a new workspace, add another account, log out, and open **Settings**.
- **Billing is per workspace.** Upgrading your work workspace doesn't upgrade your personal one.
- **Pages don't cross workspaces by themselves.** To move a page to another workspace, use **Move to** and pick the destination workspace.

2.2 The sidebar

The **sidebar** is the panel on the left. Show or hide it with `Cmd` / `Ctrl` + `</kbd>, or the <<** and **>> buttons.`

The sidebar is organized into **tabs**. Each tab has an icon, shortcut buttons at the top (such as **New page** or **My Tasks**), and **sections** that list your content. Your workspace may set up some tabs for you; you can show, hide, reorder, and reset them.

SIDEBAR ITEM	WHAT IT DOES
Search	Find any page, or jump to a recent one
Home	Upcoming events, recent pages, favorites, and tasks that need you
Chats with Notion AI	Your AI conversations and Custom Agents
Meetings	Upcoming meetings and past AI meeting notes
Inbox (top-right corner)	Mentions, comments, page updates, and reminders
New item menu (next to Inbox)	Start a page, an AI chat, or a meeting note
Library	Browse and manage every page you can access
Workspace name (bottom)	The workspace switcher and Settings

> **NOTE**
> Notion redesigns the sidebar from time to time, so yours may look slightly different. The Inbox always stays in the top-right corner of the sidebar, and your workspace name sits at the bottom.

The Home tab's sections

The **Home** tab lists your content in sections such as **Upcoming events**, **Recents**, **Favorites**, **Agents**, **Teamspaces**, **Shared**, and **Private**. **My Tasks**, **Library**, **Marketplace**, **Help**, and **Trash** are always at the bottom.

- **Collapse a section** by clicking its name.
- **Customize a section** with the ••• next to it: choose how many items show, move it up or down, or hide it.
- **Open in Library** with the book icon next to a section, to see its full list.

2.3 Private, Shared, and Teamspaces

Where a page lives decides who can see it.

SECTION	WHO CAN SEE PAGES HERE
Private	Only you
Shared	You and the specific people you shared each page with
Teamspaces	Members of that teamspace

Drag a page between sections to change who can see it. For example, drag a draft from **Private** into your team's teamspace when it's ready.

> **DANGER**
> Dragging a page into a teamspace shares it, and everything inside it, with every member of that teamspace. Check what's inside first.

Teamspaces

A **teamspace** is a shared area for one group, such as Marketing or Family, with its own members and settings. Every team workspace has at least one teamspace that everyone belongs to.

CREATE A TEAMSPACE

1. **Find the Teamspaces label** in the sidebar and click the **+** next to it.
2. **Give it a name, a description, and an icon.**
3. **Choose its access:**
   Open (anyone in the workspace can join), **Closed** (visible to everyone, but you must be invited), or **Private** (hidden from non-members; Business and Enterprise plans only).
4. **Click Create teamspace.**
5. **Add people:**
   click **•••** next to the teamspace name, then **Add members**, and choose whether each person is a teamspace **member** or **owner**.

Teamspace **owners** can see and edit everything in it and change its settings; **members** get the access the owners set. A **default teamspace** automatically includes everyone in the workspace. Notion recommends no more than three default teamspaces, even for large companies.

2.4 Favorites, Recents, and Library

- **Favorites:** right-click any page in the sidebar and choose **Add to Favorites**. Favorites appear in their own sidebar section, and on paid plans they're kept available offline automatically.
- **Recents:** pages you opened lately, in order.
- **Library:** select **Library** in the sidebar to browse everything in tabs: Teamspaces, Recents, Favorites, Shared, Private, AI Meeting Notes, Agents, and Skills. You can select several pages at once and move, delete, or unfavorite them together.

2.5 Search

Press Cmd/Ctrl + P or Cmd/Ctrl + K, or click **Search**. Start typing and results appear as you go. With no query, you'll see recently visited pages.

> **TIP**
> To search *inside* the current page, use Cmd/Ctrl + F instead.

2.6 The Inbox

The **Inbox** collects your notifications: mentions of you, comments, changes to pages you created, assignments, and reminders. A red badge means something is unread. Icons at the top let you **Mark all as read**, **Archive all**, or filter by notification type. Click any notification to jump to its page.

2.7 The parts of a page

PART	HOW TO USE IT
Icon	Hover above the title and click **Add icon**: an emoji or an image
Cover	Hover above the title and click **Add cover**: a banner image
Title	The page's name. It shows in the sidebar and in links
Body	Where your blocks go
Breadcrumb	The path at the top left, such as *Work › Projects › Launch*. Click any part to go there
Share	Who can see the page (Chapter 20)
•••	The page menu (below)

The ••• page menu

The ••• at the top right of a page holds most page-level options:

- **Style:** pick a font (**Default**, **Serif**, or **Mono**). Under **Appearance & layout**, switch on **Small text** or **Full width**.
- **Copy link**, **Duplicate**, **Move to**, and **Move to Trash**.
- **Version history:** see and restore earlier versions (Chapter 20).
- **Available offline** (desktop and mobile apps): keep the page on your device (Chapter 27).
- **More:** includes **Import**, **Export**, and **Connections**.

2.8 Trash

Deleted pages go to **Trash** (at the bottom of the Home tab). Pages stay there for **30 days**, then disappear for good. To bring one back, open Trash and click the curved arrow next to it; it returns to where it was.

> **TIP**
> Accidentally deleted something more than 30 days ago? Notion keeps its own backups and support can sometimes restore a snapshot from the past 30 days. Click **?** at the bottom of the desktop app to message support.

2.9 Settings

Open **Settings** from the workspace switcher. The sections you'll use most:

SECTION	WHAT'S THERE
Account and Preferences	Your name, photo, theme (light or dark), language, start-up page
Notifications	Which alerts you get by email, desktop, and mobile
People or Members	Invite people and change roles (team plans)
Teamspaces	Teamspace defaults and rules
Connections	Apps and integrations linked to the workspace
Notion AI	AI connectors and model settings
Sites	Your Notion Sites domains
Import	Bring content in from other apps
Billing	Plan, invoices, and payment method

> **NOTE**
> Exact names vary a little by plan and by whether you're an owner. If you can't see a section, you may not have permission; ask a workspace owner.

- [ ] I can switch workspaces and open Settings
- [ ] I know the difference between Private, Shared, and Teamspaces
- [ ] I added one page to Favorites
- [ ] I found Trash and Library
- [ ] I opened a page's ••• menu and tried Full width

CHAPTER 3

Pages and Blocks

Everything in Notion is made of **pages**, and every page is made of **blocks**. Once you understand blocks, the rest of Notion is just combining them in new ways.

IN THIS CHAPTER

- What a block is, and the three editing tools
- Every kind of block, by category
- Moving, nesting, and turning blocks into other types
- Columns, colors, toggles, and callouts
- Synced blocks: one block in many places
- Pages inside pages

3.1 Blocks: the LEGO bricks

A **block** is any single piece of content: a paragraph, a heading, a to-do checkbox, an image, a table, an embedded video. Each block can be moved, turned into another type, or nested inside another.

- Hover over any block and drag the ⋮⋮ handle to move it.
- Click the handle to **Turn into** another type, change its color, or duplicate or delete it.
- Drag a block to the far right of another block to create **columns**.

3.2 The three editing tools

TOOL	WHERE IT APPEARS	WHAT IT DOES
+	Left margin, when you hover over a new line	Opens the menu of block types to add
⋮⋮ (the "drag handle")	Left margin, when you hover over a block	Drag to move; click for the block menu
/ (slash)	Wherever you type it	The keyboard way to add blocks or run actions

The ⋮⋮ **block menu** includes: **Turn into**, **Color**, **Copy link to block**, **Duplicate**, **Move to**, **Delete**, **Comment**, **Suggest edits**, and **Ask AI**. When you select several blocks, it also shows a word and character count.

3.3 Every kind of block

Basic blocks

BLOCK	WHAT IT'S FOR	QUICK WAY TO ADD
Text	Ordinary paragraphs	Just type
Page	A subpage inside this page	`/page`
To-do list	Checkboxes	`[]`
Heading 1, 2, 3	Section titles, large to small	`#`, `##`, `###` + space
Table	A simple grid of rows and columns	`/table`
Bulleted list	Bullets	`-` + space
Numbered list	Numbered steps	`1.` + space
Toggle list	Hide content under a clickable arrow	`>` + space
Quote	A large pull-quote	`"` + space
Divider	A thin gray line	`---`
Link to page	A block that links to another page	`/link`
Callout	A boxed note with an icon	`/callout`

Media blocks

BLOCK	WHAT IT'S FOR
Image	Upload, paste a link, or pick from Unsplash
Video	Upload a file, or embed from YouTube or Vimeo
Audio	Upload a recording, or embed from Spotify or SoundCloud
File	Attach any file
Code	Code with syntax highlighting and a copy button
Web bookmark	A link preview card for any web page (`/book`)

> **NOTE**
> On the Free plan, each uploaded file can be up to 5 MB. Paid plans allow unlimited uploads, up to about 5 GB per file.

Embeds

An **embed** shows live content from another app inside your page. Notion works with 500+ embeds. Named shortcuts include Google Drive, Google Maps, Figma, Loom, Typeform, GitHub Gist, CodePen, Whimsical, and PDF. For anything else, type `/embed` and paste the link.

Advanced blocks

BLOCK	WHAT IT DOES
Table of contents (`/toc`)	Links to every heading on the page, updated automatically
Block equation (`/math`)	A full-width math formula written in TeX
Inline equation (`/equation`)	A formula inside a sentence
Button (`/button`)	Runs actions when clicked (Chapter 11)
Breadcrumb (`/bread`)	Shows where this page lives in the workspace
Synced block	The same content shown in several places (below)
Columns (`/2` , `/3` ...)	Side-by-side layout
Toggle heading 1, 2, 3	A heading that opens and closes like a toggle

Databases and views

You can also add a database right inside a page: `/table view`, `/board view`, `/calendar view`, `/gallery view`, `/list view`, `/timeline view`, `/chart`, `/form`, `/map`, and more. Chapters 5 to 8 explain databases fully.

3.4 Moving and nesting blocks

- **Move:** drag the ⋮⋮ handle up or down. A blue line shows where it will land.
- **Move to another page:** drag it onto a page in the sidebar, or use ⋮⋮ › **Move to**.
- **Nest:** press Tab to indent a block under the one above; Shift + Tab to un-indent. Nested blocks move with their parent.
- **Duplicate:** select the block (press Esc) and press Cmd/Ctrl + D, or hold Option/Alt while you drag.
- **Turn into:** click ⋮⋮ › **Turn into**, or type `/turn` at the start of a block.

> **TIP**
> Made a mistake? Cmd/Ctrl + Z undoes it, just like in any other app.

3.5 Columns

PUT TWO BLOCKS SIDE BY SIDE

1. **Hover over a block** until the ⋮⋮ handle appears.
2. **Drag it to the right edge** of another block. A vertical blue line appears.
3. **Let go.**
   The two blocks now sit in columns.
4. **Resize** by dragging the faint line between the columns.

Or type `/2` and choose **2 columns**. You can drag in as many columns as fit across the page. To undo columns, drag the blocks back out underneath each other. On phones, columns are shown one under the other.

3.6 Colors and highlights

- **Text color:** select text, click the **A** in the toolbar, and pick a text or background color.
- **Whole block:** ⋮⋮ › **Color**, or type `/red`, `/blue background`, and so on. `/default` removes color.
- **Repeat your last color:** Cmd/Ctrl + Shift + H.

3.7 Toggles and toggle headings

A **toggle** hides its contents until you click its arrow. Use toggles for FAQs, long details, or answers to quiz questions. Type `>` and a space to start one, then press `Tab` on the next line to put content inside it.

You can also make a heading collapsible: turn a heading into a **toggle heading** with ⋮⋮ › **Turn into**. Open or close every toggle on a page at once with `Cmd`/`Ctrl` + `Option`/`Alt` + `T`.

3.8 Callouts

A **callout** is a colored box with an icon, good for tips, warnings, and summaries. Type `/callout`, then click the icon to change it. You can put any blocks inside a callout, including lists and images.

3.9 Simple tables vs databases

The `/table` block is a **simple table**: a plain grid, like one in a word processor. It's perfect for a small comparison. A **database** (`/table view`) is far more powerful: every row is a page with typed properties, and you can filter, sort, and show it in many views. If you catch yourself wanting to filter or sort a simple table, it's time to use a database instead.

3.10 Synced blocks

A **synced block** shows the same content in several places. Edit any copy and every copy updates. Use it for a team mission statement, a contact list, or a disclaimer that appears on many pages.

CREATE A SYNCED BLOCK

1. **Select the blocks** you want to reuse by dragging across them.
2. **Click ⋮⋮ › Turn into › Synced block.**
   A colored border appears around them.
3. **Copy the synced block** with the copy icon.
4. **Paste it** on another page. Both copies now stay in step.

> ⚠ **WARNING**
> People who can't open the page with the original synced block won't see its contents in the copies. Share the original page with them first.

3.11 Pages inside pages

Any page can contain other pages, so you can organize everything like folders. Type `/page` to create a subpage, or `[[` and a name to link to an existing page (or create a new one). Type `@` to mention a person, a page, or a date such as `@tomorrow`; dates can carry reminders.

> **TIP**
> Keep your sidebar tidy with a few top-level "home" pages, such as **Home**, **Projects**, **Notes**, **Areas**, and **Archive**, and put everything else inside them.

3.12 Worked example: a recipe page

BUILD A RECIPE PAGE

1. **Create a page** called "Lemon pancakes" and add a food emoji icon and a cover photo.
2. **Add a callout** at the top: "Serves 4 · 20 minutes".
3. **Add two columns.**
   Left: an H2 "Ingredients" with a to-do list (tick items off as you shop). Right: an H2 "Method" with a numbered list.
4. **Add a toggle** called "Tips and variations" and put extra notes inside.
5. **Add an image block** at the bottom for a photo of your result.

- [ ] I can add blocks with **+** and with `/`
- [ ] I moved a block with ⋮⋮ and nested one with `Tab`
- [ ] I made two columns
- [ ] I tried a toggle, a callout, and a divider
- [ ] I know the difference between a simple table and a database

CHAPTER 4

Writing Faster

You can do almost everything in Notion with the mouse. But a few keyboard habits make writing much quicker, and they're easy to pick up. This chapter collects them: slash commands, Markdown shortcuts, mentions, links, and comments.

IN THIS CHAPTER

- The slash menu, and the commands worth memorizing
- Markdown shortcuts that format as you type
- Keyboard shortcuts for styling text
- Mentions with `@`, links with `[[` and `+`, and backlinks
- Comments, suggested edits, and reminders

4.1 The slash command

Type `/` anywhere to open a menu of every block and action. Keep typing to filter it, then press **Enter**. Press **Esc** if you just wanted a slash character.

TYPE	TO GET
`/text` or `/plain`	A plain text block
`/h1`, `/h2`, `/h3`	Headings (`/#`, `/##`, `/###` also work)
`/todo`	A to-do checkbox
`/bullet`, `/num`	Bulleted or numbered lists
`/toggle`	A collapsible section
`/quote`	A quote block
`/div`	A divider line

`/callout`	A highlighted box with an icon
`/code`	A code block
`/table`	A simple table
`/database`	A full database (Chapter 5)
`/image`, `/video`, `/audio`, `/file`	Media and files
`/pdf`	Show a PDF inline
`/book`	A web bookmark card
`/embed`	Embed a map, form, Figma file, and more
`/page`	A new page inside this one
`/link`	A link to another page
`/toc`	A table of contents
`/math` or `/latex`	A block equation
`/button`	A button that runs actions when clicked
`/meet`	AI Meeting Notes (Chapter 17)

Action commands

The slash menu also *does* things to the current block:

TYPE	WHAT HAPPENS
`/turn`	Turn the block into another type
`/duplicate`	Copy the block
`/moveto`	Move the block to another page
`/delete`	Delete the block
`/red`, `/blue background`	Change color (`/default` removes it)
`/mention`, `/date`, `/emoji`	Insert a mention, a date, or an emoji

4.2 Markdown shortcuts

Markdown is a simple way of formatting text with symbols. Type these at the start of a line for instant formatting:

TYPE	RESULT
`#` then space	Heading 1 (`##` for H2, `###` for H3)
`-`, `*`, or `+` then space	Bullet
`1.`, `a.`, or `i.` then space	Numbered list
`[]`	To-do checkbox
`>` then space	Toggle
`"` then space	Quote
`---`	Divider line
``` ```	Code block

And these work while you type, around a word or phrase:

TYPE	RESULT
`**text**`	**Bold**
`*text*`	*Italic*
`` `text` ``	Inline code
`~text~`	Strikethrough

> **TIP**
> Pasting Markdown from another app (for example, text an AI chatbot gave you) usually converts it into proper Notion blocks automatically.

4.3 Styling text with the keyboard

Select some text first, then:

SHORTCUT (MAC / WINDOWS)	EFFECT
Cmd / Ctrl + B	Bold
Cmd / Ctrl + I	Italic
Cmd / Ctrl + U	Underline
Cmd / Ctrl + Shift + S	Strikethrough
Cmd / Ctrl + E	Inline code
Cmd / Ctrl + K	Add a link
Cmd / Ctrl + Shift + M	Add a comment

You can also paste a web address over selected text to turn it into a link. Press Shift + Enter for a line break *inside* a block, rather than a new block.

4.4 Emoji

Type `:` followed by a word, such as `:apple` or `:clapping`, to insert an emoji. You can also use your computer's emoji picker: Ctrl + Cmd + Space on a Mac, or Win + . on Windows.

4.5 Mentions with @

Type `@` to open the mention menu:

- **Mention a person:** `@` and a name. They get a notification. Great in comments.
- **Mention a page:** `@` and a page name. This creates an inline link that updates if the page is renamed.
- **Mention a date:** `@today`, `@tomorrow`, `@next Wednesday`, or any date.
- **Add a reminder:** `@remind` followed by a date and time, such as `@remind tomorrow 9am`. Notion notifies you when it's due.

Press Esc to dismiss the menu if you just wanted an @ sign.

4.6 Links with [[and +

TYPE	SHOWS FIRST	USE IT TO
`[[` + a name	Links to existing pages	Link to a page, or create one
`+` + a name	Options to create a page	Create a subpage, or a page somewhere else

Both menus offer **+ Add new sub-page** (create a page inside this one) and **↗ Add new page in...** (create it somewhere else).

4.7 Backlinks

When you mention a page, Notion automatically records a **backlink** on the page you mentioned. Backlinks appear under the page title as "*N* backlinks". Click them to see every page that links here. This is a handy way to find related notes without any extra work.

4.8 Comments and suggestions

- **Comment on text:** select it and click **Comment**, or press Cmd/Ctrl + Shift + M.
- **Comment on a block:** use ⋮⋮ › **Comment**.
- **Comment on the whole page:** hover near the title and click **Add comment**.
- **Mention someone** in a comment with `@` so they're notified.
- **Resolve** a finished discussion by hovering over the comment and clicking the ✔️. Reopen resolved comments from the 💬 icon at the top of the page.
- **Suggest edits:** use ⋮⋮ › **Suggest edits** to propose changes that the page owner can accept or reject, like "track changes" in a word processor.

4.9 Word count

Select one or more blocks and the menu shows how many words and characters they contain.

4.10 Worked example: clean up messy notes in two minutes

FROM SCRIBBLES TO A TIDY PAGE

1. **Paste your raw notes** into a new page.
2. **Add structure:**
   put `#` and a space in front of the main topics to make headings.
3. **Make lists:**
   put `-` and a space in front of each point; press Tab to nest details.
4. **Turn tasks into checkboxes:**
   put `[]` in front of anything you need to do.
5. **Hide long details** under toggles with `>` and a space.
6. **Link related pages** with `@` so they show up as backlinks.
7. **Add a reminder** to follow up: `@remind next Monday 10am`.

- [ ] I can open the slash menu and filter it by typing
- [ ] I know at least five Markdown shortcuts
- [ ] I can bold, italicize, and link with the keyboard
- [ ] I've mentioned a page and a date with `@`
- [ ] I left a comment and resolved it

CHAPTER 5

Pages vs Databases

New Notion users often ask: “Should this be a page or a database?” This chapter answers that question, then explains how databases are put together: full-page and inline databases, data sources, and linked views.

IN THIS CHAPTER

- The difference between a page and a database, in plain English
- A simple test for choosing between them
- Full-page vs inline databases
- Data sources and linked views
- Creating, duplicating, and locking a database

5.1 The short answer

- A **page** is a document. Use it for things you *read and write*: notes, guides, essays, plans.
- A **database** is a collection of similar pages. Use it for things you *track, sort, or count*: tasks, books, clients, expenses.

Here’s the clever part: every item in a database is *also* a page. Open any row and you get a full page to write in, with the item’s properties (date, status, owner…) shown at the top.

5.2 A simple test

Ask yourself three questions:

1. **Will I have many of these?** (Ten books, fifty tasks, two hundred clients.)
2. **Do they share the same details?** (Every book has an author and a rating.)
3. **Will I want to sort, filter, or see them in different ways?** (Only unread books; tasks by due date.)

If you answered yes to two or more, use a **database**. If not, a plain **page** is fine. You can always change your mind later.

YOU'RE MAKING...	USE	WHY
Meeting notes for one meeting	Page (inside a database of meetings)	One document, but you'll have many meetings
A company handbook	Pages	Mostly reading
A to-do list for today	Page with to-do blocks	Short-lived and simple
All your tasks for the year	Database	Many items with dates and statuses
A recipe	Page	One document
A recipe collection	Database (gallery view)	Many recipes with tags and photos
Contacts or clients	Database	Many items with the same fields

> **TIP**
> A good rule of thumb: if you find yourself copying and pasting the same headings or checklist into page after page, that's a sign you want a database with a template (Chapter 11).

5.3 How a database is built

PART	WHAT IT IS	EXAMPLE (A READING LIST)
Database	The container	"Reading list"
Item (row, card, or page)	One entry	"The Hobbit"
Property	A field every item has	Author, Status, Rating
Value	What's in one property for one item	"J.R.R. Tolkien"
View	One way of displaying the items	A table of everything; a board by status

5.4 Full-page vs inline databases

TYPE	WHERE IT LIVES	BEST FOR
Full-page database	It *is* a page, listed in the sidebar	Main databases you open often
Inline database	Inside another page, between other blocks	Small databases next to related notes

- **Expand** an inline database to full screen with the ⤡ icon at its top.
- **Turn inline into full page:** drag it with ⋮⋮ into the sidebar as a top-level page.

- **Turn full page into inline:** drag it into another page in the sidebar, open that page, then click ⋮⋮ › **Turn into inline**.

5.5 Create a database

THREE WAYS TO START

1. **From a new page.**
   Create a page and, under **Get started with**, choose **Table** (or another layout).
2. **With the slash command.**
   On any page, type `/database` and pick inline or full page.
3. **With AI.**
   When you create a database, choose **Build with AI** and describe what you need, such as "a reading list with author, genre, status, and rating". Notion AI builds the properties for you.

You can also start from a **Suggested template**, or base the new database on an existing one in your workspace.

5.6 Data sources

A **data source** is the actual collection of items and properties behind a database. Most databases have one data source. But a single database can hold *several* data sources, each with its own properties. For example, a CRM database might hold separate Contacts, Companies, and Deals data sources, all managed in one place.

You don't need to think about data sources for simple setups. They matter when you build advanced systems or use the API (Chapter 25), which talks to data sources directly.

5.7 Linked views

A **linked view** shows a database that lives somewhere else, with its own filters and layout. Changes you make in a linked view change the original data, because it *is* the same data.

ADD A LINKED VIEW

1. **Open the page** where you want the view, such as your Home page.
2. **Type** `/linked` and choose the **linked view** option.
3. **Pick the database** you want to show.
4. **Set up the view:**
   choose a layout and add filters, such as *Assignee is Me*.

> **NOTE**
> Deleting a linked view only removes that view. The original database and its items are untouched.

5.8 Duplicate or lock a database

- **Duplicate:** for an inline database, use ⋮⋮ › **Duplicate**; for a full-page database, use ••• › **Duplicate**. Choose **Duplicate with content** to copy everything, or **Duplicate without content** to reuse just the structure.
- **Lock:** on a full-page database, choose ••• › **Lock database** so others can't change its properties and options by accident.

- [ ] I can explain the difference between a page and a database
- [ ] I used the three-question test on something I want to track
- [ ] I know full-page vs inline databases
- [ ] I added a linked view of a database to another page

CHAPTER 6

Database Properties

A **database** is a collection of pages that share the same set of **properties** (fields). Each item is a full page you can open and write in, *and* a row with data like a date, a status, or a person. This chapter covers every property type and how to set each one up.

IN THIS CHAPTER

- Build your first database: a reading list
- Every property type, with examples
- Editing, hiding, and reordering properties
- Status groups, date options, number formats
- Conditional color, and letting AI fill in properties

6.1 Create a database

YOUR FIRST DATABASE: A READING LIST

1. **Create a new page** called “Reading list”.
2. **Type** `/database` and choose an inline or full-page database.
3. **Rename the default columns.**
   “Name” holds the book title.
4. **Add properties.**
   Click **+** at the end of the header row. Add **Author** (Text), **Status** (Status: Not started / In progress / Done), **Rating** (Select: ★ to ★★★★★), and **Finished** (Date).
5. **Add a few books.**
   Click **New** or the empty row at the bottom.

6 **Open a book** by hovering over its name and clicking **Open**, and write your notes inside it. Every row is a page!

6.2 Property types

PROPERTY	HOLDS	EXAMPLE USE
Text	Words, with formatting	Author, notes
Number	Numbers, money, percentages	Price, hours
Select	One tag from a list	Genre, priority
Multi-select	Several tags from a list	Topics, skills
Status	To-do / In progress / Complete groups	Task progress
Date	A date or range, with optional time and reminder	Due date
Person	Workspace members or groups	Assignee
Files & media	Uploaded files and images	Contract PDF, cover photo
Checkbox	Yes or no	Paid?
URL	A web link that opens in a new tab	Website
Email	An address that opens your mail app	Contact email
Phone	A number your device can call	Client phone
Relation	Links to items in another database	Tasks ↔ Projects
Rollup	Summarizes data through a relation	% of tasks done
Formula	Calculates from other properties	Days until due
Button	Runs actions with one click	“Mark done”
ID	An automatic unique number	TASK-42
Place	A location or address	Office, venue
Created time, Created by	Set automatically when an item is made	Audit trail
Last edited time, Last edited by	Updated automatically on every edit	“Stale” check

The first column, usually called **Name**, is the item’s title. Every database has exactly one.

> **NOTE**
> Each database can have up to 500 properties. You’ll almost certainly never hit that, but if you do, delete or combine unused ones.

6.3 Adding and editing properties

- **Add:** click **+** to the right of the last column, or in a table click a column name and choose **Insert left** or **Insert right**. Give it a name and pick a type.
- **Edit:** click a column name to rename it, change its type, filter or sort by it, or run calculations.
- **Manage all properties:** open the database's settings menu (the slider icon at the top) and choose **Edit properties**. Here you can search, add, duplicate, or delete properties.
- **Hide or show** a property in the current view: settings menu › **Property visibility**, then click the 👁 next to it.
- **Reorder** columns by dragging their headers.

> **TIP**
> Hiding a property only hides it in *that view*. The data is still there. Use this to keep each view focused.

6.4 The important types, in more detail

Select and multi-select

Type an option and press Enter to create it; Notion assigns a random color. Click ••• next to an option to rename it, change its color, or delete it. Drag options by their ⋮⋮ to reorder them, which also controls how they sort.

> **TIP**
> Choose **Select** when an item can only be one thing (a task has one priority), and **Multi-select** when it can be many (a recipe can be both "vegetarian" and "quick").

Status

A **Status** property sorts its options into three groups: **To-do**, **In progress**, and **Complete**. You can rename options and add more inside each group (for example "Blocked" under In progress). Board views and progress rollups understand these groups, which makes Status better than Select for tracking work.

Date

Click a date cell to open the date picker:

- **Remind:** get a notification at a date and time.

- **End date:** turn it into a range, such as a trip from Monday to Friday. Timeline views need ranges.
- **Include time:** add a time, not just a day.
- **Date format & timezone:** choose how the date looks.
- **Clear:** remove the date.

Number

Numbers can be formatted as plain numbers, with commas, as percentages, or as currencies. You can also show a number as a **progress bar**, which is great for tracking completion (store 0.75 with the percent format and it shows as 75%).

Person

Type a name and press `Enter` to tag someone. Tagged people are notified by default. Person properties also power filters like *Assignee is Me*, and, on Business and Enterprise plans, permissions that let people see only their own items (Chapter 20).

Files & media

Click the cell to upload, paste a link, or drag files in. A gallery view can show the first image as each card's cover.

ID

An **ID** property numbers each item automatically: 1, 2, 3… You can add a prefix, such as `BUG`, to get `BUG-1`, `BUG-2`. IDs are unique and can't be edited by hand, which makes them perfect for tickets and invoices.

Place

A **Place** property holds a location: your current location, a place name, or an address. It powers the **Map** view (Chapter 7).

6.5 Conditional color

Conditional color colors items that match a rule, such as showing overdue tasks in red.

COLOR OVERDUE TASKS RED

1. **Open the settings menu** (slider icon) at the top of the view.
2. **Choose Conditional color › New color setting.**
3. **Pick the property**, such as **Due**.
4. **Set the rule**, such as *Due is before Today*.

5. **Choose a background color**, such as red. In a table, choose whether to color the whole row or just that cell.

Conditional color works in table, board, calendar, timeline, list, and feed views. You need edit access to the database to set it up.

6.6 Let AI fill in properties

Notion AI can **autofill** certain properties for every item: a one-line summary, keywords, a translation, or a category based on the page's content. Create the property, choose an AI autofill option in its settings, and describe what you want. On Free and Plus plans this is part of the limited AI trial (Chapter 16).

6.7 Page layouts

Open any database item and you'll see its properties at the top. You can design a **layout** that applies to every page in the database, choosing which properties appear first and how they're arranged. Open an item and look for the option to customize its layout near the properties.

6.8 Worked example: a property plan

Before you build, sketch your properties on paper. Here's a plan for a simple **home inventory**:

PROPERTY	TYPE	WHY
Name	Title	"Washing machine"
Room	Select	Kitchen, Garage…
Bought	Date	For warranty dates
Price	Number (currency)	For insurance
Receipt	Files & media	Proof of purchase
Warranty ends	Date	Reminders before expiry
Photo	Files & media	Gallery covers

- [ ] I built a reading list with four properties
- [ ] I know when to use Select, Multi-select, and Status
- [ ] I set a date with a reminder
- [ ] I hid a property in one view
- [ ] I set up a conditional color rule

CHAPTER 7

Database Views

A **view** is one way of looking at a database. The same tasks can appear as a table for editing, a board for tracking progress, and a calendar for deadlines, all at once, all showing the same data. Change an item in one view and it changes everywhere.

IN THIS CHAPTER

- Every view type and what it's best for
- Creating, renaming, and switching views
- How pages open from a view
- The special settings of each view
- Dashboards: many views on one screen

7.1 Views: the same data, many ways

Click + next to the existing view's name, at the top left of the database, to add a view:

VIEW	SHOWS ITEMS AS...	GREAT FOR
Table	Rows and columns	Editing lots of data
Board	Cards in columns, grouped by status or tag	Kanban task tracking
Calendar	Items on their dates	Content calendars, deadlines
Timeline	Bars across time	Project schedules
List	A clean list of pages	Notes, docs
Gallery	Cards with cover images	Recipes, portfolios, moodboards
Chart	Bar, line, donut, or number charts	Reports
Feed	Stacked posts, like a blog or social feed	Team updates, announcements

Map	Pins from a Place property	Places, travel plans
Form	A fill-in form that creates items	Requests, sign-ups, surveys
Dashboard	Several views side by side (Business and Enterprise)	Status overviews

Each view has its own **Filter** (show only some items), **Sort** (order them), and **Group** (split into sections). For example, make a "Currently reading" board view filtered to *Status is In progress*. Chapter 8 covers these in depth.

7.2 Create and manage views

ADD A VIEW

1. **Click + next to your current view's name** at the top left of the database. On a narrow screen, click the current view's name and choose **New view**.
2. **Choose a layout**, such as Board.
3. **Name the view**, such as "By status".
4. **Set it up**
   pick the property to group or plot by, then add any filters.

- **Rename, duplicate, or delete** a view: click its name.
- **Reorder views** by dragging their tabs.
- **Show tabs as icons, text, or both:** click a view tab › **Display as**. This only changes what *you* see.
- **Link to a view:** settings menu › **Copy link to view**. Share it so people land on exactly the right view.

> **NOTE**
> Each view has its own settings. Changing filters or hidden properties in one view doesn't affect the others.

7.3 How pages open

Each view decides how an item opens when you click it. In the settings menu, choose **Layout › Open pages in**:

OPTION	WHAT HAPPENS	DEFAULT FOR
Side peek	Opens on the right; the database stays usable on the left	Table, board, list, timeline
Center peek	Opens in a focused window in the middle	Gallery, calendar
Full page	Opens as a normal page	Nothing by default

In peek view, jump to the next or previous item with Ctrl + J / Ctrl + K on Windows, or Ctrl + Shift + J / K on a Mac.

7.4 Each view in detail

Table

The classic grid. Useful extras:

- **Calculate:** at the bottom of a column, choose a calculation such as Sum, Average, Count, or Percent checked.
- **Wrap text:** click a column name › **Wrap text** to show long text on several lines.
- **Freeze columns:** click a column name › **Freeze up to column** so it stays visible as you scroll sideways.
- **Fill down:** select several cells and press Cmd / Ctrl + D to copy the top value down.

Board

Cards arranged in columns, one column per value of a property (usually Status). Drag a card to another column to change its value. In the settings menu you can:

- **Group by** a different property, and **sub-group** by another, such as Status columns with Priority rows.
- Change the **Card size** (small, medium, large) and the **Card preview** (page cover, page content, or an image from a Files property). Toggle **Fit image** to avoid cropping.

Calendar

Shows each item on its date. Choose which date property to use with **Show calendar by**. Hover over a day and click **+** to add an item on that date. Drag items to reschedule them.

> **TIP**
> Want your Notion deadlines next to your real meetings? Add the database to Notion Calendar (Chapter 22).

Timeline

Shows items as bars from their start to end date, like a Gantt chart. It needs a date property that holds a **range**. Use the dropdown near **Today** to zoom from hours to years. Drag a bar's ends to change its dates. Timelines can also show **dependencies** between tasks (Chapter 9).

List

A minimal list of page titles, with any properties you choose shown at the right. Perfect for notes and documents where the content matters more than the fields.

Gallery

A grid of cards, each with a preview image. Like boards, galleries have **Card preview**, **Card size**, and **Fit image** settings. Choose a Files & media property as the preview to show photos you've uploaded.

Chart

Turns your data into a **vertical bar**, **horizontal bar**, **line**, **donut**, or **number** chart. Type `/chart` on a page, or add a Chart view to an existing database. You pick what goes on each axis, such as *Status* on the X axis and *Count* on the Y axis.

> **NOTE**
> The Free plan includes one chart to try; paid plans get unlimited charts. Charts show up to 200 groups at a time, and you can't edit items from a chart view.

Feed

Shows items as stacked posts you scroll through, like a blog. Readers can comment on each post directly, and authors can see view counts. Type `/feed view` on a page, or add a Feed view to a database. Use it for weekly team updates or a family news page.

Map

Shows items as pins on a map, using a **Place** property (one is created for you if needed). Type `/map` on a page, or add a Map view. Click a pin to open its page. A map shows up to 100 items at once.

Form

Turns the database into a form that anyone you choose can fill in. Each answer becomes a new item. Forms have a whole chapter of their own (Chapter 19).

7.5 Dashboards

A **dashboard view** (Business and Enterprise plans) arranges several **widgets** in one layout. Each widget shows a view, such as a chart of tasks by status, a board of this week's work, and a calendar of deadlines.

BUILD A DASHBOARD VIEW

1. **Open a database** and click **+** to add a view, then choose **Dashboard**. Or type `/dash` on a page.
2. **Click Edit** in the database header to enter edit mode.
3. **Add a widget** with the **+** on a row, and pick an existing view or create a new one.
4. **Arrange widgets:**
   drag them into rows; drag the dividers to change widths and heights.
5. **Leave edit mode** to use the dashboard.

Dashboards hold up to 4 widgets per row and 12 in total, and can mix views from several databases. You can also ask Notion Agent: "Create a dashboard for my Tasks database that shows key metrics."

> TIP
>
> On Free and Plus plans, you can build a dashboard *page* instead: a normal page with several linked views arranged in columns. Chapter 13 shows how.

7.6 Worked example: one database, four views

Take a **Tasks** database with Name, Status, Due, Priority, and Assignee:

VIEW	LAYOUT	SETTINGS
All tasks	Table	Sorted by Due, ascending
Board	Board	Grouped by Status, sub-grouped by Priority
Deadlines	Calendar	Show calendar by Due
My week	List	Filter: Assignee is Me, Due is this week

- [ ] I added a board view grouped by Status
- [ ] I added a calendar view using a date property
- [ ] I changed how pages open in one view
- [ ] I tried a chart or gallery view
- [ ] I know dashboards need Business or Enterprise

CHAPTER 8

Filters, Sorts, and Groups

A database with fifty items is useful. A database that shows you *just the five you need right now* is wonderful. Filters, sorts, and groups do that, and each view keeps its own.

IN THIS CHAPTER

- Simple filters, and advanced filters with AND and OR
- Saving filters for everyone or just for you
- Sorting by one or several properties
- Grouping and sub-grouping
- Searching inside a database

8.1 Filters

A **filter** shows only the items that match a rule, such as *Status is not Done*.

ADD A FILTER

1. **Open the settings menu** (the slider icon) at the top of the database.
2. **Choose Filter** under View settings.
3. **Pick a property**, such as Status.
4. **Set the rule**, such as *is not › Done*.
5. **Choose Save for everyone** if everyone should see the filter in this view. Leave it unselected to keep the filter just for you.

The rules you can choose depend on the property type:

PROPERTY	EXAMPLE RULES
Text	contains, does not contain, starts with, is empty
Number	=, ≠, >, <, is empty
Select / Status	is, is not, is empty
Multi-select	contains, does not contain
Date	is today, is before, is within *next week*, is relative to today
Person	contains *Me*, is empty
Checkbox	is checked, is not checked

> **TIP**
> Filters like *Assignee contains Me* and *Due is relative to today* adjust automatically for whoever is looking and whatever day it is. Use them to build views that never need updating.

Advanced filters

An **advanced filter** combines rules with **AND** (all must be true) and **OR** (any can be true), in groups nested up to three layers deep.

BUILD AN ADVANCED FILTER

1. **Open the settings menu › Filter › Add advanced filter.**
2. **Add your first rule**, such as *Status is not Done*.
3. **Add a second rule** and choose **And** or **Or** between them.
4. **Add a filter group** for rules that belong together.

For example, “urgent work that’s mine”:

TEXT

```
Status is not Done
AND ( Priority is High
      OR Due is before Today )
AND Assignee contains Me
```

To delete a filter, open it and choose ••• › **Delete filter**.

8.2 Sorts

A **sort** orders items by a property, ascending or descending.

- **Text** sorts alphabetically; **numbers** numerically; **dates** by time.
- **Select and multi-select** sort in the order of their options. Drag options in the property menu to change that order, such as High, Medium, Low.
- **Multiple sorts:** add several and drag them by ⋮⋮ to set which applies first. For example, sort by Priority, then by Due.

Like filters, sorts can be saved for everyone or kept for you. Remove one with the **X** next to it.

8.3 Groups

Grouping splits a view into sections by a property's values, such as one section per Status. Board views are always grouped; other views can be too.

- Settings menu › **Group** › choose a property.
- **Hide** groups you don't need with 👁️, and sort the groups manually or alphabetically.
- **Hide empty groups** to reduce clutter.
- **Sub-group** for a second layer: Status columns with Priority rows, for example.
- **Remove grouping** from the same menu.

8.4 Search inside a database

Databases with at least three items get a 🔍 icon at the top. Click it and type: the view shrinks to matching items as you type.

8.5 Recipes for common views

VIEW NAME	FILTER	SORT OR GROUP
Today	Due is today	Sort by Priority
Overdue	Due is before today AND Status is not Done	Sort by Due
This week	Due is within this week	Group by Status
Waiting on others	Status is Blocked	Group by Assignee
Recently edited	Last edited time is within past week	Sort by Last edited, descending
Unread books	Status is Not started	Sort by Created time

> **NOTE**
> Filters hide items; they never delete them. If something seems to have vanished, check the view's filters first, or switch to an unfiltered view.

- [ ] I added a filter and chose whether to save it for everyone
- [ ] I built an advanced filter with AND and OR
- [ ] I sorted by two properties
- [ ] I grouped a table by Status and hid empty groups
- [ ] I made a "My tasks" view filtered to Me

CHAPTER 9

Relations, Rollups, and Sub-items

Real life is connected. Tasks belong to projects, books have authors, invoices belong to clients. **Relations** connect databases so each item knows its partners, and **rollups** summarize across those connections.

IN THIS CHAPTER

- What relations are, with a plain example
- One-way and two-way relations, and limits
- Rollups and their calculations
- Sub-items and dependencies for tasks

9.1 Relations and rollups, simply

A **relation** connects two databases. Link a **Tasks** database to a **Projects** database and each task knows its project, and each project lists its tasks. A **rollup** then summarizes across that link, such as “count of tasks” or “percent of tasks done,” shown right on the project.

Think of a relation like a string tied between two index cards. A rollup reads something off every card at the other end of the string and adds it up.

9.2 Create a relation

LINK TASKS TO PROJECTS

1. **Open the Tasks database** and add a property. Choose **Relation**.
2. **Pick the database to connect to:**
   Projects.

3. **Decide on two-way.**
   Switch on **Show on Projects** (two-way relation) so each project also gets a “Tasks” property listing its tasks.
4. **Optional limit.**
   Choose **1 page** if each task should belong to only one project, or **No limit**.
5. **Click Add relation.**
6. **Fill it in:**
   click a task’s Project cell and choose a project.

SETTING	MEANING
One-way	Only Tasks shows the link
Two-way	Both databases get a property and stay in sync
Limit: 1 page	Each item links to one item at most
Self-relation	A database related to itself, such as “Parent task” or “Next / Previous”

> **TIP**
> Name both sides clearly: “Project” on Tasks and “Tasks” on Projects. You’ll thank yourself when you build rollups and formulas.

9.3 Rollups

A **rollup** looks through a relation at one property of the related items and calculates something.

SHOW PROJECT PROGRESS

1. **In Projects, add a Rollup property** called “Progress”.
2. **Relation:**
   Tasks.
3. **Property:**
   Status.
4. **Calculate:**
   Percent per group › Complete.
5. **Show as** a bar for a visual progress meter.

Common rollup calculations:

CALCULATION	GIVES YOU	EXAMPLE
Show original	The related values themselves	All task names
Count all	How many related items	12 tasks
Count values / unique values	How many values or distinct values	3 assignees
Percent empty / not empty	Share with or without a value	40% have due dates
Sum, average, median, min, max	Number maths	Total hours
Earliest / latest date, date range	Date summaries	Next deadline
Percent per group	Share in a Status group	75% Complete

9.4 Sub-items

Sub-items break a big task into smaller tasks inside the same database.

TURN ON SUB-ITEMS

1. **Open the settings menu** at the top of the database.
2. **Under Database settings, choose More settings.**
3. **Choose Sub-items › Turn on sub-items.**

You can then show sub-items **nested in a toggle** under their parent, or as a **flattened list**. Filter options let you show parents only, parents and sub-items, or sub-items only.

> **DANGER**
> Deleting a parent item deletes all of its sub-items too. Move the sub-items out first if you want to keep them.

9.5 Dependencies

Dependencies record that one task is *blocked by* another, such as “Print flyers” is blocked by “Design flyers”. Turn them on in the same **More settings** menu. In a timeline view, dependencies appear as arrows between bars, so you can see what has to happen first.

9.6 Worked example: a tiny book club

BOOKS AND MEMBERS

1. **Create two databases:**
   Books (Title, Month) and Members (Name).

2. **Add a two-way relation** from Books to Members called “Read by”.
3. **Tick off readers** for each book in its “Read by” cell.
4. **In Members, add a rollup** “Books read”: relation *Books*, calculate **Count all**.
5. **In Books, add a rollup** “Readers”: relation *Read by*, **Count all**.

Now each member shows how many books they’ve read, and each book shows how many people read it.

- [ ] I created a two-way relation between two databases
- [ ] I added a rollup that counts related items
- [ ] I built a progress rollup using Percent per group
- [ ] I turned on sub-items in a task database

CHAPTER 10

Formulas

A **formula** property calculates a value from other properties, like a spreadsheet formula that runs on every row. Notion's current formula language (often called **Formula 2.0**) can work with text, numbers, dates, people, and even related pages. This chapter starts gently and ends with more than twenty recipes you can copy.

IN THIS CHAPTER

- How the formula editor works
- The building blocks: properties, operators, functions
- Data types, and why they matter
- 22 worked examples to copy
- Getting Notion AI to write formulas, and fixing errors

10.1 Create a formula

ADD A FORMULA PROPERTY

1. **Open the settings menu › Edit properties › New property.**
2. **Choose Formula** and give it a name.
3. **Click Edit formula.**
   The formula editor opens.
4. **Type your formula** in the box at the top.
5. **Check the preview.**
   If you opened the editor from a row, you'll see that row's result live.

The editor has three parts: the formula box at the top, a list of properties and functions on the left, and an explanation with examples on the right for whatever you hover over. If something's missing, the editor tells you what it expects.

10.2 The building blocks

PART	EXAMPLES	WHAT IT DOES
Properties	`prop("Due")`, `prop("Price")`	Reads a property's value
Maths operators	`+ - * / % ^`	Arithmetic (`+` also joins text)
Comparisons	`== != > >= < <=`	True or false checks
Logic	`and`, `or`, `not`	Combine checks
Ternary	`X ? Y : Z`	Short for `if(X, Y, Z)`
Functions	`if()`, `round()`, `dateAdd()`	Do a job and return a result

When you type `prop("Due")`, the editor shows it as a neat property chip. You can also click properties in the left panel instead of typing.

Dot notation lets you chain functions: `prop("Name").length()` is the same as `length(prop("Name"))`.

10.3 Data types

Every value has a **type**, and functions expect particular types:

TYPE	EXAMPLE	COMES FROM
Text	`"Hello"`	Text, Select, Status, URL
Number	`42`	Number, rollups
Boolean	`true` / `false`	Checkbox, comparisons
Date	`@October 16, 2026`	Date, Created time
Person	A workspace member	Person, Created by
List	`[1, 2, 3]`	Multi-select, Relation
Page	A related page	Relation

Use `format()` to turn anything into text, and `toNumber()` to turn text into a number.

10.4 Useful functions at a glance

GROUP	FUNCTIONS
Logic	`if`, `ifs`, `empty`, `and`, `or`, `not`
Text	`length`, `contains`, `substring`, `replace`, `replaceAll`, `lower`, `upper`, `trim`, `split`, `join`, `repeat`, `style`, `link`, `format`
Numbers	`round`, `ceil`, `floor`, `abs`, `min`, `max`, `sum`, `mean`, `median`, `sqrt`, `pow`, `mod`, `formatNumber`
Dates	`now`, `today`, `dateAdd`, `dateSubtract`, `dateBetween`, `dateStart`, `dateEnd`, `formatDate`, `parseDate`, `week`, `month`, `year`, `day`
Lists	`at`, `first`, `last`, `filter`, `map`, `find`, `some`, `every`, `includes`, `unique`, `sort`, `reverse`, `slice`, `concat`, `flat`
People	`name`, `email`
Variables	`let`, `lets`

In list functions, the word `current` means “the item being looked at right now”.

10.5 Worked examples: dates

1. Days until due. Negative numbers mean overdue.

DAYS LEFT

```
dateBetween(prop("Due"), today(), "days")
```

2. Overdue flag.

OVERDUE

```
if(prop("Due") < now() and prop("Status") != "Done", "⚠️ Overdue", "")
```

3. Overdue, in bold red. `style()` takes styles (`"b"` bold, `"i"` italic, `"u"` underline) and colors.

OVERDUE (STYLED)

```
if(and(now() > prop("Due"), prop("Status") != "Done"),
  style("Overdue", "red", "b"), "")
```

4. Due date two weeks after the start.

DUE

```
dateAdd(prop("Start"), 2, "weeks")
```

5. A friendly date.

NICE DATE

```
formatDate(prop("Date"), "MMMM D, YYYY")
```

6. Week label, handy for grouping journal entries.

WEEK

```
"Week " + format(week(prop("Date")))
```

7. Age in years.

AGE

```
dateBetween(today(), prop("Birthday"), "years")
```

8. Length of a date range in days.

TRIP LENGTH

```
dateBetween(dateEnd(prop("Dates")), dateStart(prop("Dates")), "days")
```

10.6 Worked examples: text and numbers

9. Full name.

FULL NAME

```
prop("First name") + " " + prop("Last name")
```

10. Price with 20% tax, rounded to two decimals.

GROSS

```
round(prop("Price") * 1.2, 2)
```

11. Show money nicely.

REVENUE LABEL

```
"Revenue: " + formatNumber(prop("Revenue"), "usd", 0)
```

12. Reading progress as a percentage.

PROGRESS

```
format(round(prop("Pages read") / prop("Total pages") * 100)) + "%"
```

13. A text progress bar from a 0–1 number.

BAR

```
repeat("●", round(prop("Progress") * 10)) +
  repeat("○", 10 - round(prop("Progress") * 10))
```

14. Priority score with `ifs` (cleaner than nested ifs).

SCORE

```
ifs(prop("Priority") == "High", 3,
    prop("Priority") == "Medium", 2,
    1)
```

15. RICE prioritization (Reach × Impact × Confidence ÷ Effort).

RICE

```
prop("Reach") * prop("Impact") * prop("Confidence") / prop("Effort")
```

16. A clickable link.

OPEN SITE

```
link("Open site", prop("URL"))
```

17. Turn a title into a web-friendly slug.

SLUG

```
lower(replaceAll(trim(prop("Name")), " ", "-"))
```

10.7 Worked examples: lists, people, and relations

18. Has the “Urgent” tag?

URGENT?

```
prop("Tags").includes("Urgent")
```

19. Names of everyone assigned.

ASSIGNEES

```
prop("Assignee").map(current.name()).join(", ")
```

20. Count related tasks.

TASK COUNT

```
prop("Tasks").length()
```

21. Count open tasks using `filter` and `current`.

OPEN TASKS

```
prop("Tasks").filter(current.prop("Status") != "Done").length()
```

22. Percent of tasks done, safe when there are none. `lets` names values so the formula reads like a sentence.

% DONE

```
lets(
  total, prop("Tasks").length(),
  done, prop("Tasks").filter(current.prop("Status") == "Done").length(),
  if(total == 0, "-", format(round(done / total * 100)) + "%")
)
```

23. Total spent from a related Expenses database.

SPENT

```
sum(prop("Expenses").map(current.prop("Amount")))
```

> **TIP**
> Long formulas can span several lines in the editor. Line breaks and indentation make them much easier to read.

10.8 Let Notion AI write it

On Business and Enterprise plans, the formula editor has a Notion AI field. Describe what you want in plain English:

PROMPT

Return ⚠️ if the due date has passed and the status isn't Done.

PROMPT

Turn the title property into a URL slug.

PROMPT

Fix the errors in this formula, and make it handle empty dates.

Notion AI can also explain a formula ("What does this formula do?"). It can't do loops or random numbers, because Notion formulas don't have them.

10.9 Where else formulas work

Besides formula properties, you can use formulas inside **button actions**, **database button actions**, and **database automation actions** (Chapter 11), for example to set a date to "today plus 3 days".

10.10 Fixing common formula errors

MESSAGE OR SYMPTOM	LIKELY CAUSE	FIX
Type mismatch	Joining a number to text	Wrap the number in `format()`
Property not found	Property renamed or deleted	Re-insert it from the left panel
Result is blank	An input is empty	Check with `empty()` first
Division error or odd result	Dividing by zero	Guard with `if(x == 0, …)`
Wrong date difference sign	Dates in the wrong order	Swap the two dates in `dateBetween`
Text comparison fails	Typo or different capitals	Copy the option name exactly

- [ ] I created a formula property and saw the live preview
- [ ] I copied a date formula and a text formula
- [ ] I used `if` or `ifs` to show a label
- [ ] I used `filter` and `current` on a relation
- [ ] I know where to ask AI for help with formulas

CHAPTER 11

Templates, Buttons, and Automations

Once your databases are set up, Notion can do the repetitive work for you. **Templates** give every new item the same starting layout, **buttons** do several things with one click, and **automations** react to changes on their own.

IN THIS CHAPTER

- Database templates, and making them repeat
- Buttons and every button action
- Button properties inside databases
- Database automations: triggers and actions
- Webhooks, Slack, and Gmail actions
- What each plan allows

11.1 Database templates

A **database template** is a pre-made page for one database: its properties are pre-filled and its body already holds headings, checklists, or anything else.

MAKE A TEMPLATE

1. **Click the arrow next to New** at the top right of the database.
2. **Choose + New template.**
   A bar at the top shows which database it belongs to.
3. **Title it** with the template's name, such as "Bug report".
4. **Pre-fill properties**, such as Priority = P1.

5. **Add body content**, such as headings “Steps to reproduce”, “Expected”, “Actual”, and a checklist.

To use it, click the arrow next to **New** and pick the template, or create a new item and choose it from the gray menu inside the empty page. Use ••• next to a template to edit, duplicate, or delete it.

> ⚠ WARNING
> Don’t fill in a relation property in a template unless every new item should link to that same page.

Repeating templates

A **repeating template** creates a new item on a schedule, such as a “Weekly review” page every Friday at 4 pm.

MAKE A TEMPLATE REPEAT

1. **Open the dropdown next to New.**
2. **Click ••• next to the template.**
3. **Open the Repeat dropdown** and choose daily, weekly, monthly, or yearly.
4. **Set the interval, start date, and time.**

11.2 Buttons

A **button** block runs a list of actions when someone clicks it. Buttons are available on every plan; a few actions need a paid plan.

CREATE A BUTTON

1. **Type** `/button` and press Enter.
2. **Name it and pick an emoji**, such as “➕ New task”.
3. **Click New action** and choose one (table below).
4. **Add more actions** if you like; they run in order.
5. **Click Done**, then try it.

ACTION	WHAT IT DOES	PLAN
Insert blocks	Adds blocks above or below the button, or at the top or bottom of the page	All
Add page to	Creates an item in a database with set properties	All
Edit pages in	Changes properties of items in a database	All
Send notification to	Notifies up to 20 people, or a Person property	All
Show confirmation	Asks “Are you sure?” first	All
Open page or URL	Opens a page or link	All
Define variables	Stores a value for later actions	All
Send mail to	Sends an email from your Gmail	Paid
Send webhook	Sends data to another app’s URL	Paid
Send Slack notification to	Posts in a Slack channel	Plus and up

> ⓘ NOTE
>
> Buttons can only add or edit pages in databases that aren’t in your **Private** or **Shared** sections. Put them in a teamspace.

Button properties

You can also add a **Button** property to a database, so every row gets its own button, such as “✅ Mark done” that sets Status to Done and Completed to today. Button property actions can act on *that row*.

11.3 Database automations

A **database automation** watches a database and runs actions when something happens, without anyone clicking. Open it from the ⚡ icon at the top of a database.

CREATE AN AUTOMATION

1. **Click ⚡ › New automation.**
2. **Name it**, such as “Stamp completion date”.
3. **Click New trigger** and choose what starts it.
4. **Click New action** and choose what happens.
5. **Click Create.**

Triggers (you can combine several, with *any* or *all*):

TRIGGER	FIRES WHEN…
Page added	A new item is created
Property edited	A chosen property changes, optionally to a specific value
Every {frequency}	On a schedule: daily, weekly, monthly, with a time and timezone

Actions include **Edit property**, **Add page to**, **Edit pages in**, **Send notification to**, **Send mail to** (Gmail), **Send webhook**, **Send Slack notification to**, and **Define variables**.

Three automations to copy

NAME	TRIGGER	ACTION
Done date	Status set to Done	Edit property: Completed = Today
New request alert	Page added	Send Slack notification to #requests
Monday digest	Every week, Monday 9:00	Send notification to the team

> ☆ IMPORTANT
>
> Automations don't trigger other automations (to prevent loops). A person clicking a button that creates a page *does* trigger them.

Webhooks

The **Send webhook** action sends an HTTP POST request (a small package of data) to a web address whenever it runs. Tools like n8n, Zapier, and Make give you a URL to receive it, which lets a Notion change kick off work in hundreds of other apps.

11.4 What each plan allows

FEATURE	FREE	PLUS AND UP
Templates and repeating templates	Yes	Yes
Button blocks (basic actions)	Yes	Yes
Database automations	Slack notifications only	All triggers and actions
Send mail, Send webhook	No	Yes

Free plan users can still *use* automations that come in templates, but can't edit them. Creating automations needs full access to the database.

- [ ] I made a database template with a checklist

- [ ] I set a template to repeat weekly
- [ ] I made a button that adds a pre-filled task
- [ ] I created an automation that stamps a completion date

CHAPTER 12

Build a Project Tracker

Let's combine everything into a small but real system: projects with tasks. This is the most popular Notion setup in the world, and once you've built it, you'll understand how every other system works.

IN THIS CHAPTER

- Two linked databases: Projects and Tasks
- Progress bars with a rollup
- Useful views for daily work
- A task template and two automations

12.1 The plan

DATABASE	PROPERTIES
Projects	Name, Status, Owner (Person), Deadline (Date), Tasks (Relation), Progress (Rollup)
Tasks	Name, Status, Assignee (Person), Due (Date), Priority (Select), Project (Relation), Days left (Formula)

12.2 Build it

BUILD PROJECTS + TASKS

1. **Create a page** called "Work hub".
2. **Add a Projects database** (`/database` , full page). Properties: **Status** (Status), **Owner** (Person), **Deadline** (Date).
3. **Add a Tasks database** inside Work hub. Properties: **Status** (Status), **Assignee** (Person), **Due** (Date), **Priority** (Select: High, Medium, Low).

4. **Link them.**
   In Tasks, add a **Relation** property pointing to **Projects**, and switch on **Show on Projects** so both sides see the link.

5. **Add progress.**
   In Projects, add a **Rollup**: relation *Tasks*, property *Status*, calculate *Percent per group › Complete*. Show it as a bar.

6. **Add a countdown.**
   In Tasks, add a **Formula** called "Days left": `dateBetween(prop("Due"), today(), "days")`.

7. **Create useful views of Tasks:**
   a **Board** grouped by Status, a **Calendar** by Due date, and a **My tasks** table filtered to *Assignee contains Me*.

8. **Add a template.**
   In Tasks, click the arrow next to **New**, choose **+ New template**, and add a checklist ("Definition of done") that every new task starts with.

12.3 Make it work for you

FINISHING TOUCHES

1. **Sort Priority options** High, Medium, Low in the property menu, then sort the board by Priority.

2. **Color overdue tasks:**
   Conditional color › *Due is before Today* › red.

3. **Add an "Overdue" view:**
   filter *Due is before today* AND *Status is not Done*.

4. **Turn on sub-items** for big tasks (Chapter 9).

5. **Add a timeline view** of Projects using a Dates range property, so you can see them across the quarter.

> **NOTE**
> Prefer not to build from scratch? The **Templates** gallery (in the sidebar, or notion.com/templates) has thousands of ready-made systems: project trackers, CRMs, habit trackers, and more. Duplicate one, then customize it.

12.4 Automate the busywork

- **Buttons** (`/button`): one click to add a pre-filled task, change several properties, or open a page.
- **Database automations** (paid plans): "when Status changes to Done, set Completed date to today and notify the owner in Slack." Find them under the ⚡ icon at the top right of a database.
- **Recurring templates:** make a template repeat, such as "Weekly review every Friday."

12.5 A weekly routine

- [ ] Monday: open **My tasks**, set this week's Due dates
- [ ] Daily: work from the **Board**, drag cards as you go
- [ ] Friday: check the **Overdue** view and each project's Progress bar
- [ ] Friday: archive finished projects by setting Status to Done

CHAPTER 13

A Personal Dashboard

A **dashboard** is a home page that pulls your important stuff into one view. Instead of hunting through databases, you open one page and see today's tasks, upcoming dates, and quick links.

IN THIS CHAPTER

- Build a Home page with columns and linked views
- Filters that keep it up to date automatically
- Quick-capture buttons
- Dashboard views on Business plans

MAKE A "HOME" DASHBOARD

1. **Create a page called Home** and give it an icon and a cover image (hover near the title to add them).
2. **Add columns.**
   Type `/2` and choose **2 columns**, or drag blocks side by side.
3. **Left column:**
   add a **linked view** of your Tasks database (`/linked`), filtered to *Assignee is Me* and *Due is this week*, shown as a **List**.
4. **Right column:**
   a linked **Calendar** view, a callout with this week's focus, and a few quick links (`[[` to link pages).
5. **Add a Chart view** of tasks by status for a visual check-in.
6. **Pin it.**
   Right-click the page in the sidebar and choose **Add to Favorites**.

A **linked view** shows a database that lives elsewhere, filtered and styled for this spot. Changes made there update the original.

13.1 Add quick-capture buttons

TWO HANDY BUTTONS

1. **"➕ Quick task":**
   a button with the action **Add page to › Tasks**, setting Assignee to *Whoever clicked* and Due to today.
2. **"📓 Today's journal":**
   a button that adds a page to a Journal database with today's date, then opens it.

13.2 Ideas for sections

SECTION	WHAT TO PUT THERE
Today	List view: Due is today, Status is not Done
Upcoming	Calendar view of the next two weeks
Focus	A callout with this week's three priorities
Reading	Gallery of books In progress
Habits	Today's habit checkboxes (Chapter 14)
Links	Your most-used pages and websites

> TIP
> In Settings › Preferences you can choose which page Notion opens on start-up. Set it to your Home dashboard.

13.3 Dashboard views

On **Business and Enterprise** plans, you can use a true **dashboard view** instead (Chapter 7): type `/dash`, then add up to 12 widgets, such as charts, boards, and calendars, in a drag-and-drop grid. It's tidier than columns, but the column method works on every plan.

- [ ] My Home page has two columns and at least two linked views
- [ ] The views filter themselves by Me and by date
- [ ] I added a quick-task button
- [ ] Home is in my Favorites

CHAPTER 14

Recipes for Your Own Life

These step-by-step builds use only what you've learned so far. Each takes 15 to 30 minutes. Build one, use it for a week, then tweak it: the best Notion systems grow out of real use.

IN THIS CHAPTER

- A second brain using the PARA method
- A reading list with progress
- A habit tracker
- A budget tracker
- A job application tracker

14.1 Recipe 1: a second brain (PARA)

A **second brain** is a trusted place for everything you want to remember. **PARA** is a popular way to organize it, using four buckets:

BUCKET	HOLDS	EXAMPLE
Projects	Short efforts with a goal and an end	"Plan the wedding"
Areas	Ongoing responsibilities	Health, Finances, Home
Resources	Topics you're interested in	Recipes, Photography
Archive	Anything finished or inactive	Last year's projects

BUILD PARA

1. **Create a page "Second brain"** with four linked sections, or one database per bucket.

2. **Create a Notes database** with properties: Type (Select: Note, Idea, Clipping), Project (Relation), Area (Relation), Resource (Relation), Created time.
3. **Create Projects and Areas databases.**
   Projects: Status, Deadline, Area (Relation). Areas: just a name and icon.
4. **Add an Inbox view** of Notes filtered to *Project is empty AND Area is empty AND Resource is empty*. New notes land here until you file them.
5. **Add a "➕ Capture" button** that adds a page to Notes and opens it.
6. **Install the Web Clipper** (Chapter 27) to save web pages straight into Notes.
7. **Weekly:**
   empty the Inbox by linking each note to a Project, Area, or Resource. Set finished projects to Done and filter them into an Archive view.

> **TIP**
> Don't over-organize. A note that's linked to *one* sensible place is findable; search and Notion AI will do the rest.

14.2 Recipe 2: a reading list

BUILD A READING LIST

1. **Create a full-page database "Books".**
   Properties: Author (Text), Status (Status: Want to read, Reading, Finished), Rating (Select: ★ to ★★★★★), Genre (Multi-select), Cover (Files & media), Pages (Number), Pages read (Number), Finished (Date).
2. **Add a Progress formula:**
   `format(round(prop("Pages read") / prop("Pages") * 100)) + "%"`.
3. **Add a Gallery view** with Cover as the card preview: your bookshelf.
4. **Add a Board** grouped by Status.
5. **Add a Chart view:**
   books finished per month (X axis Finished, grouped by month).
6. **Make a template** with headings: Summary, Favorite quotes, What I'll do differently.

14.3 Recipe 3: a habit tracker

BUILD A HABIT TRACKER

1. **Create a database "Habits log"** where each item is one day. Title: the date as text, or use a Date property called Day.
2. **Add a Checkbox for each habit:**
   Exercise, Read, Water, Sleep by 11.
3. **Add a Score formula:**

```text
toNumber(prop("Exercise")) + toNumber(prop("Read")) +
  toNumber(prop("Water")) + toNumber(prop("Sleep by 11"))
```

4. **Add a repeating template** that creates a new day every morning (daily repeat).
5. **Add a table view** sorted by Day, descending, with column **Calculate › Percent checked** under each habit.
6. **Add a line chart** of Score over Day to see your trend.

14.4 Recipe 4: a budget tracker

BUILD A BUDGET

1. **Create a Categories database:**
   Name (Groceries, Rent, Fun…), Monthly budget (Number, currency).
2. **Create a Transactions database:**
   Amount (Number, currency), Date, Type (Select: Income, Expense), Category (Relation to Categories), Account (Select).
3. **In Categories, add a rollup "Spent":**
   relation *Transactions*, property *Amount*, calculate **Sum**.
4. **Add a "Left" formula** in Categories: `prop("Monthly budget") - prop("Spent")`.
5. **Color categories** with Left below 0 in red (conditional color).
6. **Add views of Transactions:**
   This month (Date is within this month), by Category (grouped), and a donut chart of spending by category.

7. **Add a "➖ Expense" button** that adds a transaction with Type = Expense and Date = today.

> **NOTE**
> The "Spent" rollup adds up *all* transactions in a category, not just this month's. For monthly totals, start a new set of Categories each month from a template, or filter your Transactions views by month.

14.5 Recipe 5: a job application tracker

BUILD A JOB HUNT BOARD

1. **Create a database "Applications".**
   Properties: Company (Text), Role (Text), Status (Status: Saved, Applied, Interviewing, Offer, Rejected), Applied (Date), Salary (Number), Link (URL), Contact (Email), Next step (Date).
2. **Add a Board** grouped by Status: drag each application along as it progresses.
3. **Add "Days since applied":**
   `dateBetween(today(), prop("Applied"), "days")`.
4. **Add a "Follow up" view:**
   Status is Applied AND Days since applied > 7.
5. **Make a template** with sections: Job description (paste it in), Why I fit, Questions to ask, Interview notes.
6. **Set reminders** on Next step dates so Notion nudges you.

PROMPT

Using the job description on this page and my CV page, draft a short, friendly cover letter and five questions I could ask in the interview.

- [ ] I built at least one of these recipes
- [ ] I used it for a few days and changed one thing
- [ ] I added a template or a button to speed up daily entry

CHAPTER 15

Recipes for Work and Teams

These builds suit small businesses, clubs, and teams. Each one is a starting point; adapt the property names to how your group talks.

IN THIS CHAPTER

- A simple CRM
- A content calendar
- A team wiki
- A meeting notes system
- A shared request queue

15.1 Recipe 6: a simple CRM

A **CRM** (customer relationship manager) tracks the people and companies you work with, and your conversations with them.

BUILD A CRM

1. **Create three databases:**
   Companies, Contacts, and Interactions.
2. **Companies:**
   Industry (Select), Website (URL), Owner (Person), Status (Status: Lead, Active, Past).
3. **Contacts:**
   Company (Relation to Companies, two-way), Email, Phone, Role (Text), Last contacted (Rollup, below).
4. **Interactions:**
   Date, Type (Select: Call, Email, Meeting), Contact (Relation to Contacts, two-way), Notes in the page body.

5. **In Contacts, add a rollup "Last contacted":**
relation *Interactions*, property *Date*, calculate **Latest date**.
6. **Add a "Going cold" view** of Contacts: Last contacted is before *one month ago*.
7. **Add a Deals board** if you sell: a Deals database with Value (Number), Stage (Status), Company (Relation), and a chart of value by stage.

15.2 Recipe 7: a content calendar

BUILD A CONTENT CALENDAR

1. **Create a database "Content".**
Properties: Status (Status: Idea, Drafting, Editing, Scheduled, Published), Publish date (Date), Channel (Multi-select: Blog, Newsletter, Instagram, LinkedIn), Author (Person), Link (URL).
2. **Add a Calendar view** by Publish date.
3. **Add a Board** grouped by Status.
4. **Add an "Ideas" list:**
Status is Idea, sorted by Created time.
5. **Make a template** with a brief: Goal, Audience, Key points, Call to action.
6. **Automation (paid):**
when Status is set to Editing, notify the editor.

PROMPT

Look at the Content database and suggest four blog post ideas for next month that fill the gaps in our calendar. Add each as an Idea.

15.3 Recipe 8: a team wiki

A **wiki** is a shared library of how-to pages that everyone can read and improve.

BUILD A WIKI

1. **Create a teamspace** (or a top-level page) called "Wiki".
2. **Create a database "Docs"** with: Category (Select: Onboarding, Policies, How-to, Tools), Owner (Person), Last reviewed (Date), Last edited time.
3. **Add a List view** grouped by Category as the wiki's front page.

4. **Add a "Needs review" view:**
   Last reviewed is before six months ago.
5. **Make a doc template** with sections: Purpose, Steps, Who to ask.
6. **Use synced blocks** for content that appears on many pages, such as support contacts.
7. **On Business plans, verify pages:**
   mark trusted pages as **verified** so they show a badge in search and AI answers.

> **TIP**
> Put a short "Start here" page at the top of the wiki that links the five pages a new person needs first.

15.4 Recipe 9: a meeting notes system

BUILD MEETING NOTES

1. **Create a database "Meetings".**
   Properties: Date, Type (Select: 1:1, Team, Client), Attendees (Person), Project (Relation to Projects).
2. **Make a template per type**, each with Agenda, Notes, Decisions, and Action items (to-dos).
3. **On Business plans, add AI Meeting Notes:**
   type `/meet` in the template body so each meeting can be transcribed and summarized (Chapter 17).
4. **Add views:**
   a Calendar by Date, and "This week" filtered by Date.
5. **Make a weekly 1:1 template repeat** every week.
6. **After each meeting,** turn action items into tasks with Notion AI.

PROMPT

```
Read this meeting page and add every action item to my Tasks database,
with the right assignee, a due date if one was mentioned, and a link back
to this meeting.
```

15.5 Recipe 10: a shared request queue

BUILD A REQUEST QUEUE

1. **Create a database "Requests"** with Status, Requester (Created by), Priority (Select), Assigned to (Person), and an ID property with the prefix `REQ`.
2. **Add a Form view** (Chapter 19) with questions for the title, details, and priority.
3. **Share the form** with your workspace or the web.
4. **Add a Board** for the team, grouped by Status.
5. **Automation:**
   when a page is added, notify the team or post in Slack.

15.6 Recipe 11: the project tracker

Recipe 11 is the Projects + Tasks system from Chapter 12. Link it to Meetings and Docs with relations, and you have the core of a small company's workspace.

- [ ] I built one work recipe and shared it with one other person
- [ ] I added a template so every new item starts the same way
- [ ] I tried an AI prompt on the system I built

CHAPTER 16

Notion AI

Notion AI is built into the workspace. It can write and edit, answer questions using your pages (and connected apps), take meeting notes, build databases, and carry out multi-step tasks as an **agent**. This chapter covers the everyday AI tools; the next two cover meetings, search, and Custom Agents.

IN THIS CHAPTER

- What's included on each plan
- Five ways to use Notion AI
- Notion Agent: what it can and can't do
- Choosing an AI model
- Personalizing your Agent, and reusable skills
- Prompts to copy

16.1 What's included

PLAN	AI FEATURES
Free, Plus	A limited trial of Notion AI features
Business, Enterprise	Notion Agent, AI Meeting Notes, Enterprise Search across connected apps, and the full set of AI writing tools, within a usage allowance
Custom Agents	Free to try, then paid with **Notion credits** (an add-on: $10 per 1,000 credits per month)

NOTE

Notion says it doesn't use your data to train its AI models unless you opt in, and its AI providers are contractually barred from training on customer data. On Enterprise, the AI providers keep no copy of your data (zero data retention).

16.2 Ways to use Notion AI

- **On an empty line:** press `Space` and ask: “Draft a project kickoff agenda.”
- **On selected text:** select it, then choose **Ask AI** to improve, shorten, translate, or change the tone. Built-in skills such as **Improve writing**, **Proofread**, **Explain**, and **Reformat** appear in the selection menu.
- **In the AI chat** (the AI face at the bottom right): ask questions across your workspace. “What did we decide about the launch date?” It answers with links to the source pages.
- **AI Meeting Notes:** type `/meet` to transcribe and summarize a meeting with action items (Chapter 17).
- **AI in databases:** add AI-generated properties such as summaries, keywords, or translations that fill in automatically for every row, and ask AI to write formulas.

16.3 Notion Agent

The **Notion Agent** is your AI teammate. It uses the same permissions as you: if you can’t see a page, neither can it. By default it looks at the page you’re on; select blocks to focus it, or click **@** to add pages or people as context. Click 📎 to upload a file.

What it can do:

- **Multi-step work:** search, then create pages or databases from what it finds.
- **Answer questions** about your workspace, databases, comments, and version history, and connected apps such as Slack.
- **Create and edit pages and databases**, including views, properties, relations, maps, and forms.
- **Work with files:** read PDFs, CSVs, spreadsheets, Word and PowerPoint files, do calculations, and create downloadable files.
- **Manage your Inbox:** group, summarize, and archive notifications.
- **Use connected apps:** post in Slack, draft and send Gmail messages (after you confirm), and find meeting times in your calendar, once you connect them in `Settings` › `Notion AI` › `AI connectors`.
- **Connect other apps through MCP servers:** in the chat, choose **All sources › MCP servers › Add MCP server**.

What it can’t do (at the time of writing): create database automations, templates, or advanced properties like formulas, rollups, and buttons; create comments; share pages or change permissions; start AI Meeting Notes; set reminders; or change workspace settings.

PROMPT

Look through my meeting notes from the last two weeks, find every action item assigned to me, and add each one to my Tasks database with a due date and a link back to the meeting.

PROMPT

Turn this brainstorm page into a Projects database with a row for each idea, and fill in a one-sentence summary and an estimated effort.

PROMPT

Analyze the customer feedback in this CSV. Give me the top five themes, the overall sentiment, and three recommendations, citing examples.

16.4 Choosing a model

Click **Auto** in the chat to pick a different AI model. Notion offers models from Anthropic (Claude), OpenAI (GPT), Google (Gemini), and others. **Auto** lets Notion choose the best model for each task, and is a good default.

> ☆ IMPORTANT
>
> **Premium models** spend Notion credits, and a workspace admin must turn each one on in Settings › Notion AI. Some models can only use the web, not your workspace, so check the note in the model menu.

16.5 Personalize your Agent

GIVE YOUR AGENT INSTRUCTIONS

1. **Click the Agent's face** at the bottom of Notion, then click the face again in the chat window.
2. **Give it a name and accessories**, if you like.
3. **Choose Add instructions** and pick an existing page, a template, or **Create your own page** (a private page called *My Notion AI*).
4. **Write your preferences:**
   your role, how you like answers formatted, and which pages or channels to check first.

16.6 Skills

A **skill** is a page of reusable instructions for one kind of job, such as "Turn notes into a recap email". Mark any page as a skill and run it from the chat; Notion Agent can also pick a skill by itself when it fits. Find your skills in the **Skills** tab of **Library**.

> **TIP**
> A good rule: if you'd paste the same prompt twice, make it a skill.

16.7 Chat tips

- **Switch chat mode** between a sidebar and a floating window.
- **Pin** chats you return to often.
- **Find old chats** by hovering over Notion AI in the sidebar and clicking 🕘.
- **Give feedback** with thumbs up or down. Feedback isn't used to train your Agent.

16.8 Prompts that work well

GOAL	PROMPT
Summarize	"Summarize this page in five bullets for a busy manager."
Rewrite	"Rewrite this in plain English for a 12-year-old."
Translate	"Translate this page into Spanish, keeping the headings."
Build	"Create a database to track my house plants, with watering dates."
Find	"Which pages mention the Berlin office? Link them."
Plan	"Make a four-week study plan for my exam on the date in this page."

- [ ] I asked AI to draft something on an empty line
- [ ] I improved a paragraph with Ask AI
- [ ] I asked the AI chat a question about my workspace
- [ ] I wrote personal instructions for my Agent

CHAPTER 17

AI Meeting Notes and Enterprise Search

Two Notion AI features save time every single day on Business and Enterprise plans: **AI Meeting Notes**, which listens to a meeting and writes it up, and **Enterprise Search**, which finds answers across Notion and your other apps.

IN THIS CHAPTER

- Recording and summarizing a meeting
- Uploading audio, speaker labels, and custom summaries
- Searching across connected apps with citations
- Connecting Slack, Google Drive, and more

17.1 AI Meeting Notes

AI Meeting Notes transcribes a meeting (turns speech into text), then writes a summary with key points and action items. It's included on Business and Enterprise plans; Free and Plus get a limited trial.

WHERE	WHAT IT HEARS	BEST FOR
Desktop app	Your microphone *and* your computer's sound	Video calls
Browser	Only your microphone	In-person meetings
Mobile app	Only your phone's microphone	In-person meetings

TAKE AI MEETING NOTES

1. **Type** `/meet` on any page in the desktop app (or start one from **Upcoming events** on Home).

2. **Jot agenda items** under **Notes** before the meeting. The summary will take them into account.
3. **Click Start transcribing** when the meeting starts. This confirms everyone has agreed to be recorded.
4. **Click Stop** at the end. The summary starts writing automatically (you need at least one minute of audio).
5. **Review the summary.**
   Hover over a citation to see the exact part of the transcript it came from.

> ☆ IMPORTANT
> Always tell people you're transcribing and get their consent. Laws on recording conversations differ between countries and states.

More options

- **Upload a recording:** open the meeting notes block's settings and choose **Upload audio** (AAC, M4A, MP3, or WAV).
- **Speaker labels:** the desktop app labels who said what, best in one-to-one video calls. For Google Meet in Chrome, the Notion Meetings browser extension improves labels.
- **Change the summary style:** under **Instructions** at the bottom of the block, switch from **Auto** to a format such as a sales call or standup, or click **+ Add custom instructions** to design your own.
- **Calendar link:** connect Notion Calendar to start notes from an event in one click (Chapter 22).
- **Automatic sharing:** in `Settings` › `Notion AI` you can auto-share notes with workspace members who were invited to the event. Otherwise notes are private to you.

PROMPT

```
From this meeting's notes, write a short follow-up email to the client
that thanks them, confirms the three decisions, and lists next steps.
```

17.2 Enterprise Search

Enterprise Search answers questions using your Notion workspace, your connected apps, and the web, and always cites its sources. Open **Home** and type your question in the search window.

- **Narrow the scope:** click **All sources** to switch off web search, or to search only your workspace, one teamspace, or one app such as Slack.
- **Add context:** click **Add context** or `@`-mention pages, teamspaces, and people.
- **Databases count too:** it can read views, relations, and properties.

Connect your other apps

Notion AI Connectors let AI search other tools. Set them up in `Settings` › `Notion AI` › `AI connectors`. Available connectors include Slack, Microsoft Teams, Google Drive, Gmail, Google Calendar, Microsoft Outlook, GitHub, and more; Notion lists Jira, Box, OneDrive, Salesforce, and Asana as beta.

> **NOTE**
> Connectors respect permissions: you'll only get answers from content you could already open in that app.

17.3 Research mode

For bigger questions, **Research mode** (beta) uses deeper reasoning to write a detailed report from your workspace, connected tools, and current web information. It's available on Business and Enterprise, with a limited trial elsewhere.

PROMPT

```
Research what our customers said about onboarding in the last quarter,
using Slack, support notes, and meeting notes. Write a two-page report
with quotes and recommendations.
```

- [ ] I know which app to use for video calls vs in-person meetings
- [ ] I recorded or uploaded a meeting and read its summary
- [ ] I asked Enterprise Search a question and checked its citations
- [ ] I connected at least one other app, or know where to do it

CHAPTER 18

Custom Agents and Notion Credits

Custom Agents are AI teammates that run on their own: on a schedule, or when something happens. You set them up once, and they keep doing a job, such as writing a weekly report or sorting incoming requests, in the background.

IN THIS CHAPTER

- Notion Agent vs Custom Agents
- Building your first Custom Agent
- Triggers, access, and models
- Safety: permissions, logs, and reviews
- Notion credits: what they cost and how to track them
- Claude agents in Notion (beta)

18.1 Notion Agent vs Custom Agents

	NOTION AGENT	CUSTOM AGENT
Starts when	You ask in chat	A schedule, an event, or a mention
Sees	Everything you can see	Only what you grant it
Good for	One-off tasks	Recurring jobs
Plan	Business, Enterprise	Business, Enterprise, plus credits

18.2 Build your first Custom Agent

CREATE AN AGENT

1. **Go to Agents** in the sidebar and click **+** (you'll need the desktop or web app).
2. **Choose how to start:**
   describe the job in an **AI chat**, pick a **template**, or **Create blank**.
3. **Review the draft** instructions, triggers, and access that Notion suggests. Edit until they match what you want.
4. **Test it** in the agent's chat: ask it to do a one-off run and watch what it does.
5. **Save and publish.**
   From now on it runs whenever its triggers fire.

Write instructions like a brief for a new colleague: the job, the outcome you want, the steps, and an example of good output.

PROMPT

> Every Friday at 3pm, read all pages in the Projects database that were edited this week. Write a status update with one section per project: what changed, risks, and next steps. Post it as a new page in the Weekly updates database and keep it under 400 words.

18.3 Triggers

TRIGGER TYPE	EXAMPLES
Recurring schedule	Every day at 9:00, every Monday, monthly, with a timezone
Notion events	A page is added to a database, a property is updated, a comment is added, a page is removed, an AI Meeting Note finishes
Slack events	A message in a channel, an emoji reaction, the agent is @-mentioned

You can add filters, such as "only when Status is New" or "only messages containing *bug*". Slack triggers need a Slack admin to connect Slack to Notion first.

18.4 Access and tools

An agent only touches what you give it. In **Settings › Tools and access**:

- **Add specific pages and databases**, such as “Support tickets”.
- **Web access:** switch on if the job needs the internet; keep it off for internal work.
- **Slack:** pick exactly which channels it can read and post in.
- **MCP connections:** link other apps.
- **Other agents:** let it hand parts of a job to other Custom Agents.

> **NOTE**
> Linking a page inside the instructions doesn’t grant access to it. Add it under Tools and access.

18.5 Models

Leave the model on **Auto** to start. You can pick a stronger model for planning and checking, and lighter, faster models for simple jobs. Premium models cost more credits.

18.6 Safety by design

- **Permission levels: Full access** (configure everything and see logs), **Can edit** (change instructions), **Can view and interact** (run and chat with it).
- **Activity log:** every run is recorded: what triggered it, what it did, and any errors.
- **Version history:** restore an earlier setup if a change goes wrong.
- **Enterprise audit log:** configuration changes are recorded for admins.

> **TIP**
> Give agents narrow, specific jobs and limited access (“only the Support database and the #help channel”). Review their logs for the first week before trusting them fully.

18.7 Notion credits

Notion credits are a paid add-on for Business and Enterprise plans. They’re shared across the workspace and pay for Custom Agents, Workers (custom code), premium AI models, and AI use beyond your plan’s allowance.

TYPE	PRICE	HOW IT WORKS
Monthly credits	$10 per 1,000 credits	Billed monthly; reset each month; unused credits don’t carry over
Annual credits	$13 per 1,000 credits	Paid upfront; use any time in the year; expire at renewal

Admins buy credits and watch usage in the **Notion credits dashboard**, and can set a credit limit for each person. Longer jobs, more reading, and premium models use more credits. Custom Agents are free to try before you need credits.

> ⚠ **WARNING**
> Sub-agents and hand-offs also spend credits. Check each agent's **Activity** and **Insights** tabs after testing to see what a run really costs.

18.8 Claude agents in Notion (beta)

On Business and Enterprise, some workspaces can add **Claude agents**: agents from Anthropic that you chat with and assign work to inside Notion. Create one from **Agents › New Agent › Claude**. They're paid with Notion credits (no Anthropic account needed), see only what you share with them, and can't browse the web. They're off by default on Enterprise and HIPAA workspaces; owners switch them on under `Settings` › `Notion AI`.

18.9 Agent ideas

AGENT	TRIGGER	JOB
Request triage	Page added to Requests	Set priority, assign an owner, reply with next steps
Weekly report	Every Friday	Summarize project changes
Q&A helper	Mentioned in #help	Answer from the wiki, with links
Meeting follow-up	AI Meeting Note finished	Create tasks from action items
Wiki gardener	Monthly	List docs not reviewed in six months

- [ ] I know the difference between Notion Agent and Custom Agents
- [ ] I drafted instructions for one recurring job
- [ ] I limited the agent's access to the pages it needs
- [ ] I know how credits are priced and where usage is shown

CHAPTER 19

Forms

A **form** collects answers from people, even people who don't use Notion, and drops each response into a database as a new item. Forms are available on every plan.

IN THIS CHAPTER

- Creating a form, new or from a database
- Question types and settings
- Sharing your form and its submission settings
- What each plan adds

19.1 Create a form

A NEW FORM

1. **Type** `/form` on a page and choose **Form**.
2. **Give it a title and description**, and hover over the title to add an icon or cover.
3. **Click into each question** to edit it, and use **+** below the last one to add more.
4. **Click Preview** to see it as a respondent will.

A **Respondent** property is created automatically to record who answered (unless you allow anonymous answers).

To add a form to an **existing database**, click **+** next to its views and choose **Form**, then **Create questions**. You need full access to the database.

19.2 Questions and properties

Every question *is* a database property. Add a question "What's your favorite color?" and a property with that name appears. Rename the question and the property is renamed too, unless you switch off **Sync with property name**.

Click ••• on a question to:

- Make it **Required**.
- Add a **Description**.
- Change its **Question type** (text, multiple choice, date, person, file, and more).
- Allow a **Long answer** for text.
- Show choices as a **list or dropdown**, and limit how many can be chosen.
- Add **conditional logic** (Business and Enterprise): show different follow-up questions depending on an answer.

Form settings › Submit screen lets you change the button's text and color, the thank-you message, and get an email copy of each submission.

19.3 Share your form

PUBLISH A FORM

1. **Click Share form** at the top of the form builder.
2. **Choose Who can fill out:**
   Anyone at your workspace with link, *Anyone on the web with link*, or *No access* (closes the form).
3. **Copy the link** and send it, or embed it on a website.

For workspace-only forms with names recorded, **Access to submission** decides what respondents can do with their answer afterwards: nothing, view, comment, edit, or full access.

PLAN	FORMS
Free	Basic forms
Plus	Custom forms, and no Notion branding on public forms
Business, Enterprise	Custom forms plus conditional logic

> **TIP**
> Pair a form with an automation: when a page is added, notify the right person or post in Slack. You've built a request system in five minutes.

> **NOTE**
> You can't create or customize forms on a phone, and the Form view itself can't be exported. Export responses from a table view instead.

19.4 Form ideas

- Event RSVP: name, attending (yes or no), dietary needs.
- Bug report: summary, steps, screenshot (file), severity.
- Customer feedback: rating (select 1–5), comments, may we contact you?
- Content pitch: title, angle, deadline.

- [ ] I created a form and previewed it
- [ ] I made one question required
- [ ] I shared it with a link and submitted a test response

CHAPTER 20

Sharing, Permissions, and Guests

Notion is built for working with others, but you stay in control of who sees what. This chapter explains the Share menu, the access levels, members and guests, and how to work together with comments and version history.

IN THIS CHAPTER

- Sharing a page with people, teamspaces, or the web
- Every access level, explained
- Members, admins, owners, and guests
- Database permissions by person
- Comments, notifications, and version history

20.1 Sharing a page

Click **Share** at the top right of any page:

- **Invite** people by email and choose their access: **Full access**, **Can edit**, **Can comment**, or **Can view**.
- **General access**: decide whether only invited people, everyone in your workspace, or anyone with the link can open it.
- **Publish** (the **Publish** tab in the Share menu): turn the page into a public website with **Notion Sites** (Chapter 21).

Pages inherit sharing from their parent: share a parent page and everything inside it is shared too.

SHARE WITH A FEW PEOPLE

1. **Click Share.**
2. **Type names or email addresses.**
   People outside your workspace become guests.
3. **Pick an access level** from the dropdown next to them.
4. **Click Invite.**
   They get an email, and the page appears in their **Shared** section.

20.2 Access levels

LEVEL	CAN VIEW	CAN COMMENT	CAN EDIT	CAN SHARE
Full access	Yes	Yes	Yes	Yes
Can edit	Yes	Yes	Yes	No
Can edit content (databases)	Yes	Yes	Items only	No
Can comment	Yes	Yes	No	No
Can view	Yes	No	No	No

Can edit content lets people add and edit database items without changing the database's structure, views, or filters. **Can create** (Business and Enterprise) lets people add new items to a database without seeing other people's items, which is ideal for tickets and submissions.

20.3 General access

SETTING	WHO CAN OPEN THE PAGE
Only people invited	You and the people you've added
Everyone at your workspace	Any workspace member, by search or link (you can hide it from search)
Anyone on the web with link	Anyone with the link, even without a Notion account

For web links you can set an expiry under **Link expires**. Visitors need to log in to comment or edit.

> **DANGER**
> "Anyone on the web with link" means *anyone*. Links get forwarded. Don't use it for private information, and set an expiry for temporary sharing.

20.4 Members, admins, owners, and guests

ROLE	WHAT THEY CAN DO	PAID SEAT?
Workspace owner	Everything, including billing and security settings	Yes
Membership admin	Add and remove members and groups	Yes
Member	Use teamspaces and create content	Yes
Guest	Only the specific pages shared with them	No

Add members in Settings › People (called **Members** on some plans): choose **Add members**, enter an email, pick a role, and click **Invite**. You can also share an invite link, or let anyone with your company email domain join automatically under **Allowed email domains**.

To add a **guest**, share a page with their email and choose **Skip for now** so they're added as a guest, not a member. Guests need their own (free) Notion account. The Free plan allows up to 10 guests; paid plans allow more.

> **TIP**
> Use guests for clients, contractors, and family members who only need a few pages. They don't cost a seat.

20.5 Groups

On team plans, **groups** (such as "Design" or "Managers") let you share with many people at once. Share a page with the group and everyone in it gets access; add someone to the group later and they get access automatically.

20.6 Database permissions by person

On Business and Enterprise plans, a database with a Person property (or Created by) can give people access only to *their* items. Open the source database, click **Share**, and under **Page-level access** choose **Add a new rule**. For example: people in the *Assignee* property can edit those tasks, and nothing else.

20.7 Stop sharing

- Drag the page into your **Private** section, or
- Open **Share** and choose **Remove** next to a person, group, or teamspace.

20.8 Working together

- **Comments:** select text and click **Comment**, or hover over a block and use its comment icon. Mention teammates with `@`.
- **Page history:** ••• menu, then **Version history**, to see and restore earlier versions. The history length depends on your plan: 7 days on Free, 30 on Plus, 90 on Business, and unlimited on Enterprise.
- **Notifications:** the **Inbox** in the sidebar collects mentions, comments, and reminders.
- **Access requests:** if someone asks for more access to your page, you can approve or reject it from your Inbox.

> ⚠ **WARNING**
> Before publishing a page to the web, check the subpages inside it. They're published too, unless you change their settings.

- [ ] I shared a page with one person at Can comment
- [ ] I checked the General access setting on an important page
- [ ] I know the difference between a member and a guest
- [ ] I restored an earlier version from Version history

CHAPTER 21

Notion Sites

Notion Sites turns any page into a public website with one click: a portfolio, a résumé, a blog, an event page, or a help center. The site updates automatically whenever you edit the page.

IN THIS CHAPTER

- Publishing a page as a site
- Slugs, search engines, and embedding
- Customizing on paid plans
- Using your own domain, and what it costs

21.1 Publish a site

PUBLISH A PAGE

1. **Open the page** and click **Share**.
2. **Open the Publish tab** and click **Publish**.
3. **Click View site** to see it live at a `notion.site` address.

> ⚠ WARNING
> Publishing a page also publishes all of its subpages. Check them first, and remember that a site's metadata can include the names and photos of people who edited it.

21.2 Site settings

After publishing, open **Share › Publish** again:

- **Copy the link** to share it.

- **Slug** (paid plans): the part after the domain, as in `notion.site/my-slug`. Letters, numbers, and hyphens only, up to 60 characters.
- **Search engine indexing:** switch on **Discoverable on the web** so Google can find it. It can take up to four weeks to appear. Paid plans can edit the title and description search engines show.
- **Duplicate as template:** let visitors copy your page into their own workspace.
- **Embed this page:** copy code to put the page, a form, or a chart on another website.
- **All published sites:** see everything you've published.

21.3 Customize your site (paid plans)

Open **Share › Publish › Site customization**:

SETTING	WHAT IT CHANGES
Share preview	The image and text shown when the link is shared
Theme	System, Light, or Dark
Favicon	The little icon in the browser tab
Header	Breadcrumbs, search, navigation links, and the Notion watermark
Google Analytics	Add a measurement ID to count visitors

Click **Publish changes** when you're done.

21.4 Plans and domains

FEATURE	FREE	PAID PLANS
Published sites	Unlimited	Unlimited
`notion.site` **domains**	1	Up to 5
Search engine indexing	Yes	Yes, with custom title and description
Homepage, customization, analytics	No	Yes
Your own domain	No	Add-on: $10/month per domain, or $8/month billed yearly

Use your own domain

CONNECT A CUSTOM DOMAIN

1. **Buy a domain** from a domain provider if you don't have one. Notion doesn't sell domains.
2. **Go to** Settings › Sites and click **New domain › Custom domain**.
3. **Enter the domain with a subdomain**, such as `www.mysite.com`.

4. **Add a CNAME record** at your domain provider pointing to `external.notion.site.` (note the final period).
5. **Wait for it to connect**, then set the page as the domain's homepage.

With a custom domain you can also remove the "Built with Notion" watermark. You can connect up to 25 custom domains.

> **TIP**
> To make `mysite.com` (without www) work too, set up a redirect to `www.mysite.com` at your domain provider.

- [ ] I published a test page and opened it in a private browser window
- [ ] I checked which subpages were published with it
- [ ] I know how to turn search indexing on or off

CHAPTER 22

Notion Calendar (and Notion Mail)

Notion Calendar is a free calendar app that shows your Google, iCloud, or Microsoft Outlook calendars alongside your Notion databases. It's a separate app that signs in with your Notion account.

IN THIS CHAPTER

- Getting Notion Calendar on every device
- Connecting calendars and Notion workspaces
- Showing Notion databases on your calendar
- Starting AI Meeting Notes from an event
- What happened to Notion Mail

22.1 Get Notion Calendar

Notion Calendar runs on **Mac**, **Windows**, the **web**, **iPhone and iPad**, and **Android**. Download it from the Notion website or your app store. FREE

SET IT UP

1. **Sign up with your Notion account.**
   If you don't have one, Notion creates one with the same email.
2. **Connect a calendar:**
   Google, iCloud, or Microsoft Outlook. You can add several accounts.
3. **Connect your Notion workspace:**
   open **Settings**, and under **Notion workspaces** choose **Add Notion workspace**. Repeat for each workspace.

> **TIP**
> Sign up with an email you'll always have, such as a personal address. You can add work calendars afterwards.

22.2 Show a Notion database on your calendar

Any database with a **Date** property can appear in Notion Calendar, so tasks, content, and deadlines sit next to your meetings.

ADD A DATABASE

1. **Find your Notion workspace** at the bottom of Notion Calendar's left sidebar.
2. **Hover over it and click ••• › Add Notion database.**
3. **Search for the database** and select it.

You need at least **Can view** access to show a database, and **Can edit content** access to add or move items from the calendar.

22.3 Meetings and notes

When you create an event, use **Add AI meeting notes** to create a new meeting page or attach an existing one. Notes made this way are private by default; you can share them automatically with workspace members who are invited (Chapter 17).

22.4 Mobile widgets

Notion Calendar has home screen widgets on iOS and Android, and lock screen widgets on iOS. Customize them in the app's settings.

22.5 What happened to Notion Mail?

Notion Mail, an email app for Gmail, shut down on **September 22, 2026**. Your emails were always stored in Gmail, so they're safe there. Notion now handles email through **Notion Agent**: connect Gmail in `Settings` › `Notion AI` › `AI connectors`, and the Agent can search your inbox, draft replies, and send messages after you confirm.

PROMPT

```
Search my Gmail for emails from Acme about the contract this month,
summarize where things stand, and draft a polite reply to the latest one.
```

- [ ] I installed Notion Calendar and connected a calendar
- [ ] I connected my Notion workspace
- [ ] I added a database with dates to the calendar

CHAPTER 23

Import, Export, and Backups

Your content belongs to you. Notion can bring in notes and documents from other apps, and it can export everything so you always have your own copy.

IN THIS CHAPTER

- Importing files and other apps
- Exporting pages as PDF, HTML, or Markdown & CSV
- Backing up your whole workspace
- Trash, version history, and recovery

23.1 Import

Imports work on desktop and web (not mobile). Start one in any of three ways:

- `Settings` › `Import`, then choose an app or file type.
- Type `/` on a page and search for the importer, such as `/csv` or `/trello`.
- **••• › More › Import** on the page you want to import into.

YOU CAN IMPORT	BECOMES
Text and Markdown (.txt, .md)	Pages
Microsoft Word (.docx), HTML, PDF	Pages
CSV	A database
ZIP of files	Pages and folders
Evernote	Notebooks become pages; notes become database items
Trello	Boards become databases; cards become items; lists become groups
Confluence, Asana, Monday.com, Google Docs, Dropbox Paper, Excel, and more	See the importer for each

Track progress under `Settings` › `Import` in the **In progress** and **Complete** tabs.

> **TIP**
> Importing a lot? Try a small batch first and check how it looks. Trello and Evernote imports are reliable up to about 5,000 cards or notes; split anything bigger.

23.2 Export a page

EXPORT A PAGE

1. **Click ••• › More › Export** on the page.
2. **Choose a format:**
   PDF, HTML, or Markdown & CSV.
3. **Choose options:**
   whether to include files and images, and whether to **Include subpages**.
4. **Click Export.**
   Big exports arrive as an emailed download link.

FORMAT	BEST FOR
PDF	Printing and sharing a fixed copy
HTML	A browsable offline copy, including comments
Markdown & CSV	Moving to other apps; databases become CSV files

> **NOTE**
> PDF export with subpages needs a Business or Enterprise plan. You can't print a full-page database directly: export it as PDF first.

23.3 Back up your whole workspace

EXPORT EVERYTHING

1. **Open** Settings › General.
2. **Click Export all workspace content.**
3. **Choose HTML or Markdown & CSV.**
4. **Check your email** for the download link. It expires after 7 days, and big workspaces can take up to 30 hours.

The export only includes pages *you* can access. It can't be re-imported to rebuild the workspace instantly, but it keeps your words safe. There's no built-in automatic backup schedule.

> **TIP**
> Windows can't open very deep ZIP folders. If your export won't unzip, untick **Create folders for subpages**, or use a tool like 7-Zip.

23.4 Recovery

PROBLEM	FIX
Deleted a page	**Trash**: restore within 30 days
Broke a page	••• › **Version history**: restore an earlier version
Deleted longer ago	Contact Notion support; they keep backups for 30 days

- [ ] I imported a file or a CSV
- [ ] I exported one page as PDF and one as Markdown
- [ ] I know how to export my whole workspace

CHAPTER 24

Connect Notion to Other Tools

Notion works best when it talks to the other apps you use. This chapter covers built-in connections, link previews, the Web Clipper, and automation tools such as Zapier, Make, and n8n.

IN THIS CHAPTER

- Connections in Settings
- Link previews and embeds
- Slack and other popular connections
- No-code automation tools

24.1 Built-in connections

Notion connects with Slack, Google Drive, GitHub, Jira, Figma, and many more. Paste a link from those apps and choose **Paste as preview** for a live card. Manage connections under `Settings` › `Connections`.

ADD A CONNECTION

1. **Open** `Settings` › `Connections`.
2. **Search or filter** for the app.
3. **Open it and follow the steps** to sign in and approve access.
4. **Add it to pages:**
   on a page, click ••• › **More**, find **Connections**, and choose **Add connections**.

> **NOTE**
> On Enterprise plans, workspace owners can limit which connections members may install. If you can't find one, ask an owner.

24.2 Link previews and embeds

PASTE OPTION	SHOWS
Mention	A small inline link with the app's icon
Paste as preview	A live card (a GitHub pull request, a Figma frame, a Jira ticket)
Embed	The content itself, inside the page
Bookmark	A link card with a title and image

24.3 Popular connections

APP	WHAT IT DOES
Slack	Notifications from automations; AI search and actions in Slack
Google Drive	Previews and embeds of Docs, Sheets, and Slides; AI search
GitHub, Jira, Asana	Previews, and on Business plans synced databases
Figma	Live previews of designs
Gmail	Send mail from buttons and automations; Agent actions

24.4 No-code automation tools

Zapier, Make, and n8n all have Notion integrations (for example, "add every new form response to a Notion database"; see the *n8n* manual). Typical recipes:

- New email with a label → new item in a Notion database.
- New row in a Google Sheet → new Notion page.
- Notion item set to Done → message in a chat app.
- Notion **Send webhook** action → start a workflow in n8n.

These tools sign in to Notion with **OAuth** (a "log in and approve" screen) and ask which pages they may access. Pick only the pages they need.

> **TIP**
>
> If a tool says it “can’t find” your database, open the database’s **••• › More › Connections** and check the tool is listed. Chapter 25 explains why.

- [ ] I opened Settings › Connections
- [ ] I pasted a link as a preview
- [ ] I know which automation tool I’d use, and how it gets access

CHAPTER 25

The Notion API: A Beginner Example

The **API** (application programming interface) is how programs talk to Notion: reading pages, adding database items, and reacting to changes. You don't need to be a developer to try it. This chapter walks you through your first API call, step by step.

IN THIS CHAPTER

- Connections, tokens, and why sharing matters
- Creating an internal connection
- Your first request with curl
- Adding a database item from the command line and from JavaScript
- API versions, webhooks, and personal access tokens

25.1 Key words

WORD	MEANING
Connection	A program's identity in Notion, formerly called an *integration*
Internal connection	A connection for your own workspace only
API token	A secret password the program sends with every request
Endpoint	A web address the API answers at, such as `https://api.notion.com/v1/pages`
Data source	The collection of items behind a database (Chapter 5)
JSON	The text format the API uses for data

25.2 Step 1: create a connection

For Zapier, Make, n8n, or your own scripts, create a **connection** (Notion's developer docs call it an *internal connection*, formerly an *integration*):

CREATE AN API CONNECTION

1. **Open the developer portal** at app.notion.com/developers/connections. You need to be a workspace owner.
2. **In the Build section, choose Internal connections**, then **Create a new connection**. Give it a name and pick the workspace.
3. **Copy the API token** from its **Configuration** tab. Treat it like a password. Here you can also choose its **capabilities**, such as read, update, and insert content.
4. **Grant access to pages.**
   Either add pages in the connection's **Content access** tab, or open a page, click **••• › More › Connections › Add connections**, and pick your connection.
5. **Paste the token** into n8n, Zapier, or your script's credentials.

> **NOTE**
> A new connection can't see *anything* until you share pages with it. Sharing a parent page also shares its subpages. If an automation says "object not found," this is almost always why.

> **DANGER**
> Never paste your token into a web page, a shared document, or code you upload to GitHub. Store it in an **environment variable** (a setting on your computer that programs can read). If a token leaks, create a new one.

25.3 Step 2: test the token

Open a terminal (Terminal on a Mac, PowerShell on Windows). First, store your token in an environment variable so it doesn't appear in your commands. On a Mac or Linux:

TERMINAL

```
export NOTION_API_KEY="paste-your-token-here"
```

Now ask Notion who your connection is:

TERMINAL

```
curl https://api.notion.com/v1/users/me \
  -H "Authorization: Bearer $NOTION_API_KEY" \
  -H "Notion-Version: 2026-03-11"
```

If it works, you'll get back a short JSON answer describing your connection's **bot user**. An error saying `unauthorized` means the token is wrong.

> ☆ IMPORTANT
>
> Every request must include a `Notion-Version` header. Notion names versions by date; the latest is `2026-03-11`. Older versions keep working, but new examples in the docs use the latest one.

25.4 Step 3: add an item to a database

Make a small database called "Groceries" with three properties: **Grocery item** (the title), **Price** (Number), and **Last ordered** (Date). Share it with your connection (Step 1, item 4).

Next you need the **data source ID**, a long code identifying the database's data source. Copy it from the database's **Manage data sources** option in Notion, then store it:

TERMINAL

```
export NOTION_DATA_SOURCE_ID="paste-the-id-here"
```

Now create a page (an item) in it:

TERMINAL

```
curl https://api.notion.com/v1/pages \
  -H "Authorization: Bearer $NOTION_API_KEY" \
  -H "Content-Type: application/json" \
  -H "Notion-Version: 2026-03-11" \
  --data "{
    \"parent\": { \"data_source_id\": \"$NOTION_DATA_SOURCE_ID\" },
    \"properties\": {
      \"Grocery item\": {
        \"title\": [{ \"text\": { \"content\": \"Tomatoes\" } }]
      },
      \"Price\": { \"number\": 1.49 },
      \"Last ordered\": { \"date\": { \"start\": \"2026-09-01\" } }
    }
  }"
```

Open the database: "Tomatoes" is there. Running the command again adds another copy.

ERROR	USUALLY MEANS
`400` **validation error**	A property name or value doesn't match the database
`401` **unauthorized**	The token is wrong or missing
`403`	The connection lacks a capability, such as insert content
`404` **not found**	Wrong ID, or the database isn't shared with the connection

25.5 The same thing in JavaScript

If you have Node.js installed, Notion's official SDK (a ready-made code library) makes this tidier. Install it in a new folder:

TERMINAL

```
npm install @notionhq/client
```

Save this as `create-page.mjs`:

CREATE-PAGE.MJS

```
import { Client } from "@notionhq/client";

const notion = new Client({ auth: process.env.NOTION_API_KEY });

const page = await notion.pages.create({
  parent: { data_source_id: process.env.NOTION_DATA_SOURCE_ID },
  properties: {
    "Grocery item": { title: [{ text: { content: "Bread" } }] },
    Price: { number: 2.5 },
    "Last ordered": { date: { start: "2026-10-16" } },
  },
});

console.log("Created page:", page.id);
```

Run it with `node create-page.mjs`. The SDK sets the version header for you.

PROMPT

Using the Notion API version 2026-03-11 and the @notionhq/client SDK, write a Node.js script that reads every item in my data source and prints the titles of items whose Price is over 5. Explain each line.

25.6 More you can do

- **Query a data source** to read items with filters and sorts.
- **Append blocks** to add content to a page.
- **Webhooks:** let Notion send your server a message when content changes, instead of checking constantly.
- **Public connections** use OAuth so other people can install your app in *their* workspaces.
- **Personal access tokens** (from the developer portal) act as *you*, with your own permissions, for personal scripts and trusted tools.

The full reference lives at developers.notion.com.

- [ ] I created an internal connection and copied its token safely
- [ ] I shared a database with the connection
- [ ] I ran the “who am I” request
- [ ] I added an item with curl or JavaScript

CHAPTER 26

Notion MCP: Connect AI Assistants

MCP (Model Context Protocol) is a standard way for AI apps to use other tools. Notion runs an official **MCP server**, so assistants like Claude, ChatGPT, Cursor, and Claude Code can search, read, create, and update your Notion pages and databases (see the *MCP* manual in this series).

IN THIS CHAPTER

- What Notion MCP does, and how it differs from the API
- Connecting Claude, Claude Code, Codex, Cursor, and others
- What an assistant can do once connected
- Security and admin controls

26.1 How it works

Notion MCP is a **remote** server hosted by Notion at `https://mcp.notion.com/mcp`. Your AI app connects to it, you sign in with **OAuth** (a Notion "approve access" screen), and the assistant can then use Notion tools: search, fetch pages, create pages and databases, update properties, add comments, and more.

	NOTION MCP	NOTION API
Built for	AI assistants	Programs you write
Sign-in	OAuth, as you	Token for a connection
Sees	Everything *you* can see	Only pages shared with the connection
Setup	Minutes, no code	Code required

26.2 Connect your assistant

- **Claude:** Settings › Connectors, find **Notion**, click **Connect**, and approve.
- **Claude Code:** `claude mcp add --transport http notion https://mcp.notion.com/mcp`, then `/mcp` to sign in.
- **Cursor and others:** add a remote server with the URL `https://mcp.notion.com/mcp`.

Codex

Add this to `~/.codex/config.toml`, then run `codex mcp login notion`:

CONFIG.TOML

```
[mcp_servers.notion]
url = "https://mcp.notion.com/mcp"
```

Cursor

Create `.cursor/mcp.json` in your project (or `~/.cursor/mcp.json` for every project), then enable Notion in Cursor and complete the sign-in:

MCP.JSON

```
{
  "mcpServers": {
    "notion": {
      "url": "https://mcp.notion.com/mcp"
    }
  }
}
```

Any other MCP client

OPTION	USE WHEN
Streamable HTTP: `https://mcp.notion.com/mcp`	The default; try this first
SSE: `https://mcp.notion.com/sse`	The app doesn't support Streamable HTTP
`npx -y mcp-remote https://mcp.notion.com/mcp`	The app only supports local (stdio) servers

> **TIP**
>
> In Claude Code, `--scope user` makes the Notion server available in every project, and `--scope project` shares it with your team through a `.mcp.json` file.

26.3 Things to ask once connected

PROMPT

Search my Notion for the Q3 launch plan and summarize the open risks.

PROMPT

Create a Notion page called "Release notes 2.4" in my Engineering teamspace from the changes in this repository's last ten commits.

PROMPT

Add these five customer requests to my Requests database in Notion, setting Priority to Medium and linking each to the right company.

26.4 Security

You sign in with OAuth, and the AI can only see pages *you* can see. That also means it can see *everything* you can see, so:

- **Start with personal use** before rolling it out to a team.
- **Use clear page titles**, because AI relies on them to find things.
- **Review what the assistant changes**, especially bulk edits.
- **Disconnect** apps you no longer use from your workspace settings.

Workspace owners can review and restrict these connections in `Settings` › `Connections`. On the **Enterprise** plan, owners can allow only approved AI apps: under **Permissions**, set **Restrict AI apps members can connect** to **Only from approved list**.

> **NOTE**
> Notion also offers an older, open-source MCP server you run yourself, but Notion says it's no longer actively maintained. Use the hosted server unless you have a special reason.

- [ ] I connected one AI app to Notion MCP
- [ ] I asked it to search and summarize a page
- [ ] I know the assistant sees everything I can see

CHAPTER 27

Notion on Desktop and Mobile

Notion runs in a web browser, as a desktop app for Mac and Windows, and as a mobile app for iPhone, iPad, and Android. Everything syncs between them.

IN THIS CHAPTER

- Why use the desktop app
- Tabs, windows, and Command Search
- Working offline
- The mobile app and widgets
- The Web Clipper

27.1 Which app to use

APP	STRENGTHS
Web (notion.so in a browser)	Nothing to install; works anywhere
Desktop (Mac, Windows)	Tabs, notifications, offline pages, AI Meeting Notes that hear call audio, spell check
Mobile (iOS, Android)	Quick capture, widgets, offline pages, meeting notes in person

Download them from notion.com/download.

27.2 The desktop app

- **Tabs:** `Cmd` / `Ctrl` + `T` opens a new tab; `Cmd` / `Ctrl` + click opens a link in a new tab. New tabs open search by default (change this in `Settings` › `Preferences`).
- **Windows:** `Cmd` / `Ctrl` + `Shift` + `N` opens a new window.

- **Command Search:** search Notion or ask Notion AI from anywhere on your computer, with a keyboard shortcut or the menu bar (Mac) or taskbar (Windows). Adjust it in `Settings` › `Preferences`.
- **Notifications:** desktop alerts for mentions, assignments, and reminders.
- **Spell check:** built in; right-click a word to switch it off or on.

27.3 Working offline

MAKE A PAGE AVAILABLE OFFLINE

1. **Open the page** in the desktop or mobile app.
2. **Click ••• and switch on Available offline.**
   A progress bar shows the download.
3. **Repeat on each device**
   offline pages are stored per device.

On Plus, Business, and Enterprise, your recent and favorite pages are downloaded automatically. See and remove offline pages in `Settings` › `Offline`.

> **NOTE**
> Offline, you can read and edit most blocks. Embeds, forms, buttons, sharing, and AI Meeting Notes need a connection. Offline isn't available in a web browser.

27.4 The mobile app

- **Capture fast:** tap the new page button, or share a link or photo into Notion from other apps.
- **Columns** show one under the other on phones.
- **Widgets:** long-press your home screen, add a Notion widget, and choose a page, or the **AI widget** to jump straight into Notion AI by chat, camera, or voice.
- **Meeting notes** on mobile record through the phone's microphone, so they suit in-person meetings.

Forms and some advanced settings can only be created on desktop or web.

27.5 The Web Clipper

The **Web Clipper** saves web pages into Notion, perfect for reading lists and research. It's a browser extension for Chrome and Safari (from notion.com/web-clipper).

CLIP A PAGE

1. **Install the extension** and log in to Notion in your browser.
2. **Click the Notion icon** next to the address bar on any web page.
3. **Choose the workspace and the page or database** to save it in, or click **+ New links database**.
4. **Click Save page.**

- [ ] I installed the desktop or mobile app
- [ ] I made one important page available offline
- [ ] I added a widget or the Web Clipper

CHAPTER 28

Plans and Pricing

Notion has four plans. You pay per **member** (someone in your workspace); guests are free. Most individuals never need more than the Free plan.

IN THIS CHAPTER

- The four plans and their prices
- What changes between plans
- Add-ons: Notion credits and custom domains
- Students, billing, and refunds

28.1 The plans

PLAN	PRICE PER MEMBER	GOOD FOR
Free	$0	Individuals: unlimited pages and blocks; limited file uploads and history; an AI trial
Plus	$10/month billed yearly ($12 monthly)	Small teams and power users: unlimited uploads, longer history, more guests
Business	$20/month billed yearly ($24 monthly)	Teams that want Notion AI and agents, SSO, and private teamspaces
Enterprise	Custom	Advanced security, admin controls, and AI data protections

From notion.com/pricing, October 2026. Students and teachers can often get Plus free with a school email.

28.2 What changes between plans

FEATURE	FREE	PLUS	BUSINESS	ENTERPRISE
Pages and blocks	Unlimited alone; limited with 2+ members	Unlimited	Unlimited	Unlimited
File uploads	5 MB per file	Unlimited	Unlimited	Unlimited
Page history	7 days	30 days	90 days	Unlimited
Guests	10	More	More	More
Charts	1	Unlimited	Unlimited	Unlimited
Forms	Basic	Custom	+ conditional logic	+ conditional logic
Automations	Basic buttons	Database automations	Same	Same
`notion.site` **domains**	1	5	5	5
Notion AI	Trial	Trial	Included	Included
AI Meeting Notes, Enterprise Search	Trial	Trial	Yes	Yes
Private teamspaces, SAML SSO	No	No	Yes	Yes
Dashboard views, row-level permissions	No	No	Yes	Yes
SCIM, audit log, zero data retention for AI	No	No	No	Yes

28.3 Add-ons

ADD-ON	PRICE	PLANS
Notion credits (Custom Agents, premium models, Workers)	$10 per 1,000 monthly, or $13 per 1,000 annual	Business, Enterprise
Custom domain for Sites	$10/month per domain, or $8/month billed yearly	Paid plans

28.4 Which plan should I choose?

- **Just me:** Free. Upgrade to Plus only if you need big file uploads or longer history.
- **Student or teacher:** Plus, free with a school email (one member).
- **Small team:** Plus.
- **Team that wants AI, meeting notes, and agents:** Business.
- **Large company with security needs:** Enterprise.

28.5 Billing basics

- **Change plans** in `Settings` › `Billing`. Upgrades apply immediately (pro-rated); downgrades at the end of the billing period.
- **Adding members** mid-cycle creates a pro-rated charge. Removing one frees the seat for someone else until renewal.
- **Invoices** are under `Settings` › `Billing` › Invoices.
- **Refunds:** Notion refunds in full if you downgrade within three days of a monthly sign-up, or 30 days of a yearly one (longer where local law requires, such as 14 days in the EU).

> **TIP**
> Not sure? Notion offers trials of paid plans. Try Business with your team for a couple of weeks before committing.

- [ ] I know which plan I'm on (Settings › Billing)
- [ ] I know whether I need AI features, and which plan includes them
- [ ] I know guests don't cost a seat

CHAPTER 29

Keyboard Shortcuts Cheatsheet

On a Mac use Cmd; on Windows and Linux use Ctrl. Where Mac uses Option, Windows uses Shift (or Alt, as noted).

29.1 Getting around

SHORTCUT	ACTION
Cmd / Ctrl + P or K	Search, or jump to a recent page
Cmd / Ctrl + F	Find on this page
Cmd / Ctrl + N	New page
Cmd / Ctrl + T	New tab (desktop)
Cmd / Ctrl + Shift + N	New window (desktop)
Cmd / Ctrl + [/]	Back / forward
Cmd / Ctrl + Shift + U	Go up to the parent page
Cmd / Ctrl + L	Copy the page link
Cmd / Ctrl + </kbd>	Show or hide the sidebar
Cmd / Ctrl + Shift + L	Toggle dark mode
Cmd / Ctrl + + / -	Zoom in / out

29.2 Writing and styling

SHORTCUT	ACTION
Cmd / Ctrl + B / I / U	Bold / italic / underline
Cmd / Ctrl + Shift + S	Strikethrough
Cmd / Ctrl + E	Inline code
Cmd / Ctrl + K **(text selected)**	Add a link
Cmd / Ctrl + Shift + M	Comment
Cmd / Ctrl + Shift + H	Reapply last color
Shift + Enter	Line break inside a block
Tab / Shift + Tab	Indent / un-indent

29.3 Turn the current line into...

Press Cmd + Option (Mac) or Ctrl + Shift (Windows) plus a number:

- 0 Text
- 1 Heading 1
- 2 Heading 2
- 3 Heading 3
- 4 To-do
- 5 Bullet
- 6 Numbered list
- 7 Toggle
- 8 Code
- 9 Page

29.4 Working with blocks

SHORTCUT	ACTION
Esc	Select the current block (or clear selection)
Cmd / Ctrl + A	Select the block your cursor is in
Shift + ↑ / ↓	Extend the selection
Cmd / Ctrl + D	Duplicate selected blocks
Cmd / Ctrl + /	Turn into, recolor, or move selected blocks
Cmd / Ctrl + Shift + arrows	Move the selected block
Cmd / Ctrl + Enter	Open a page, tick a to-do, open a toggle
Cmd / Ctrl + Option / Alt + T	Expand or collapse all toggles
Backspace	Delete selected blocks

29.5 Typing tricks

Insert anything: `/` · **Mention or date:** `@` · **Reminder:** `@remind` · **Link a page:** `[[` · **Create a page:** `+` · **Emoji:** `:` + name

Markdown: `#` `##` `###` headings · `-` bullet · `1.` number · `[]` to-do · `>` toggle · `"` quote · `---` divider · ```` ``` ```` code

Inline: `**bold**` · `*italic*` · `` `code` `` · `~strike~`

CHAPTER 30

Tips and Troubleshooting

Most Notion problems have a simple cause: a filter, a permission, or a setting. Find your symptom below.

30.1 Finding things

PROBLEM	TRY THIS
Can't find a page	Cmd / Ctrl + P to search; check **Trash** in the sidebar (deleted pages are kept for 30 days)
A page vanished from the sidebar	It may be inside another page; search for it and check its breadcrumb
Search doesn't show a page	You may not have access, or it's set to Hide in search; ask the owner
Database items are "missing"	A view filter is hiding them; check **Filter** or switch views
New items appear in the middle	Large databases (1,000+ items) may sort new items oddly; add a sort

30.2 Sharing and access

PROBLEM	TRY THIS
Someone can't open a shared link	Check **Share** settings; they may need an invitation, or general access widened
Can't invite a guest	Guest limit reached, guests disabled, or their email domain isn't allowed
Teammate sees a page they shouldn't	It inherits sharing from a parent or teamspace; move it to Private or change Share
Synced block looks empty to others	They can't access the page with the original block
Can't edit a database's properties	You have Can edit content, or the database is locked
Export option missing	An Enterprise owner disabled export, or a guest needs Full access

30.3 Databases and formulas

PROBLEM	TRY THIS
Database feels cluttered	Create views with filters instead of deleting data
Timeline is empty	It needs a date property with a range (start and end)
Map is empty	Add a Place property and real addresses
Rollup shows nothing	Check the relation is filled in and the right property is chosen
Formula error	Check property names, wrap numbers in `format()`, guard empty values
Board won't group by a property	Boards group by Select, Status, Person, and similar types
Chart limit reached	Free has one chart; upgrade or delete an old chart

30.4 Automations and connections

PROBLEM	TRY THIS
Automation can't find my page	Share the page with the connection (••• › More › Connections)
API returns 404 "object not found"	The database isn't shared with the connection, or the ID is wrong
API returns 400 validation error	Property names or types don't match the database
Database automation didn't run	It was triggered by another automation, or targets a Private page
Button does nothing	The target database is in Private or Shared; move it to a teamspace
Slack action unavailable	Needs Plus or above, and a connected Slack workspace
AI app can't see Notion	Reconnect Notion MCP and sign in again; check Enterprise allowlists

30.5 Notion AI and agents

PROBLEM	TRY THIS
AI says it's unavailable	Your workspace may have hit its usage allowance; it refreshes within hours
A model is missing	An admin must enable premium models, or you hit your credit limit
Meeting notes didn't hear others	Use the desktop app for calls; the browser and phone only hear your mic
No summary after a meeting	At least one minute of audio is needed
Custom Agent did the wrong thing	Open its Activity log, then tighten its instructions and access
Custom Agent ignores a page	Add it under Tools and access; links in instructions don't grant access

30.6 Apps, sync, and performance

PROBLEM	TRY THIS
Page is slow	Very large databases or embeds slow things down; split them or use filtered views
Want to work offline	Use the desktop or mobile app and mark key pages **Available offline**
Offline page isn't on my phone	Offline is per device; turn it on there too
App behaves strangely	Update it, log out and in, or reset the app's cache from its help menu
Can't log in	Check you're using the same sign-in method (email, Google, or Apple) as before
Exported ZIP won't open on Windows	Untick Create folders for subpages, or use 7-Zip
Site not on Google	Turn on search indexing and wait up to four weeks

> **TIP**
>
> Still stuck? Click **?** at the bottom of the desktop app to message Notion support, check status.notion.so for outages, or ask Notion AI: "How do I...?"

Quick Reference

Insert anything: `/` · **Link a page:** `[[` · **Mention a person, page, or date:** `@` · **Ask AI:** `Space` on an empty line

Formatting: `#` heading · `-` bullet · `[]` to-do · `>` toggle · `---` divider

Databases: properties = fields · views = Table / Board / Calendar / Timeline / List / Gallery / Chart / Feed / Map / Form / Dashboard · filter, sort, group per view · relation + rollup to connect databases

Formulas: `prop("Name")` · `if()` / `ifs()` · `dateBetween(a, b, "days")` · `format()` · `.filter(current…)`

Automation: templates (repeatable) · `/button` · ⚡ database automations (paid)

Share: Share › invite or publish · sharing a parent shares its subpages · guests are free

AI: Notion Agent (chat) · `/meet` meeting notes · Enterprise Search on Home · Custom Agents with Notion credits

AI connections: Notion MCP `https://mcp.notion.com/mcp` · API: create a connection, then share pages with it · header `Notion-Version: 2026-03-11`

Glossary

Advanced filter	A filter that combines rules with AND and OR, in nested groups.
AI Meeting Notes	A Notion AI feature that transcribes a meeting and writes a summary with action items.
API	Application programming interface: the way programs read and change Notion content.
API token	A secret password a connection sends with every API request.
Backlink	An automatic link back to a page from every page that mentions it.
Block	Any single piece of content on a page, such as a paragraph, heading, image, or to-do.
Button	A block that performs set actions, like adding a pre-filled task, when clicked.
Callout	A boxed block with an icon, used for tips, warnings, and summaries.
Conditional color	A view setting that colors items matching a rule, such as overdue tasks in red.
Connection	A link between Notion and another app or script, which needs pages shared with it. Formerly called an integration.
CRM	Customer relationship manager: a system for tracking contacts, companies, and conversations.
Custom Agent	A Notion AI agent that runs on a schedule or trigger to do a recurring job.
Dashboard	A page that collects important views and links in one place.
Dashboard view	A Business and Enterprise view that arranges several database views as widgets.
Data source	The collection of items and properties behind a database. A database can hold several.

Database	A collection of pages that share the same properties, viewable in many layouts.
Database automation	A rule that runs actions automatically when a database changes or on a schedule.
Database template	A pre-made page layout and property values for new items in one database.
Dependency	A link recording that one task is blocked by another.
Embed	Live content from another app shown inside a page.
Endpoint	A web address where the API answers a particular kind of request.
Enterprise Search	Notion AI search across your workspace, connected apps, and the web, with citations.
Environment variable	A named setting on your computer that programs can read, used to keep tokens out of code.
Filter	A rule that shows only database items that match, such as Status is In progress.
Form	A database view that collects answers from people as new items.
Formula	A property that calculates its value from other properties.
Guest	Someone outside your workspace who can only access pages shared with them. Guests don't use a paid seat.
Inbox	The sidebar area that collects mentions, comments, updates, and reminders.
Inline database	A database that sits inside another page, between other blocks.
JSON	A text format for structured data, used by the Notion API.
Library	The sidebar area for browsing and managing every page you can access.
Linked view	A view of a database placed on a different page.
Markdown shortcut	Typing symbols like `#` or `-` to format text instantly.
MCP	Model Context Protocol, the standard that lets AI apps connect to Notion and other tools.
Member	A person who belongs to a workspace and uses a paid seat on paid plans.
Notion Agent	Notion AI's ability to carry out multi-step tasks in your workspace.
Notion Calendar	Notion's free calendar app that shows your calendars and Notion databases together.

Notion credits	A paid add-on that funds Custom Agents, premium models, and extra AI use.
Notion Sites	Notion's feature for publishing pages as public websites.
OAuth	A sign-in-and-approve process that lets one app access another without sharing your password.
Page	A document in Notion that can contain blocks and other pages.
PARA	A way to organize notes into Projects, Areas, Resources, and Archive.
Peek	Opening a database item in a side or center panel without leaving the view.
Personal access token	A token that lets a script act as you, with your own permissions.
Property	A field on a database item, such as Date, Status, or Person.
Relation	A property that links items in one database to items in another.
Rollup	A property that summarizes related items, such as counting tasks or averaging values.
Skill	A Notion page of reusable instructions that Notion AI can run.
Slug	The part of a web address after the domain, such as `my-page` in `notion.site/my-page`.
Sort	A view setting that orders items by a property.
Status	A property type that groups options into To-do, In progress, and Complete.
Sub-item	A smaller item nested under a parent item in the same database.
Synced block	A block whose content appears and updates in several places at once.
Teamspace	A shared area of a workspace for a specific team, with its own members.
Template	A reusable starting layout for a page or database item.
Toggle	A block that hides its contents until you click its arrow.
Version history	A record of earlier versions of a page that you can restore.
View	One way of displaying a database: table, board, calendar, timeline, and more.
Web Clipper	A browser extension that saves web pages into Notion.
Webhook	A message one app sends to a web address to tell another app something happened.
Workspace	Your whole Notion environment, containing all your pages and members.
